

Status of HB TB2002 data analysis

Shuichi Kunori
Jordan Damgov
04-Dec-2002

All results are preliminary!

HB Testbeam 2002

Dates:

- June 26-July 1 “ECAL” // July 24-July 31 HF // Aug. 01- Sep. 18 HB

Goals (HB):

- Demonstrate 144ch working
- Demonstrate DCS going
- Source data vs GeV/ADC
- Muon signal in HO for muon trigger
- Eta dependence (attenuation)
- Eta dependence (timing)
- Pulse shape (needs TDC)
- Weight in Layer 0

(beam: $e / \mu / \pi$)

→ start construction of Calibration Database

Additional Goals (left over from 1999TB)

- Crack between wedges
- e/π (resolution and linearity)
- Cerenkov light in clear fibers

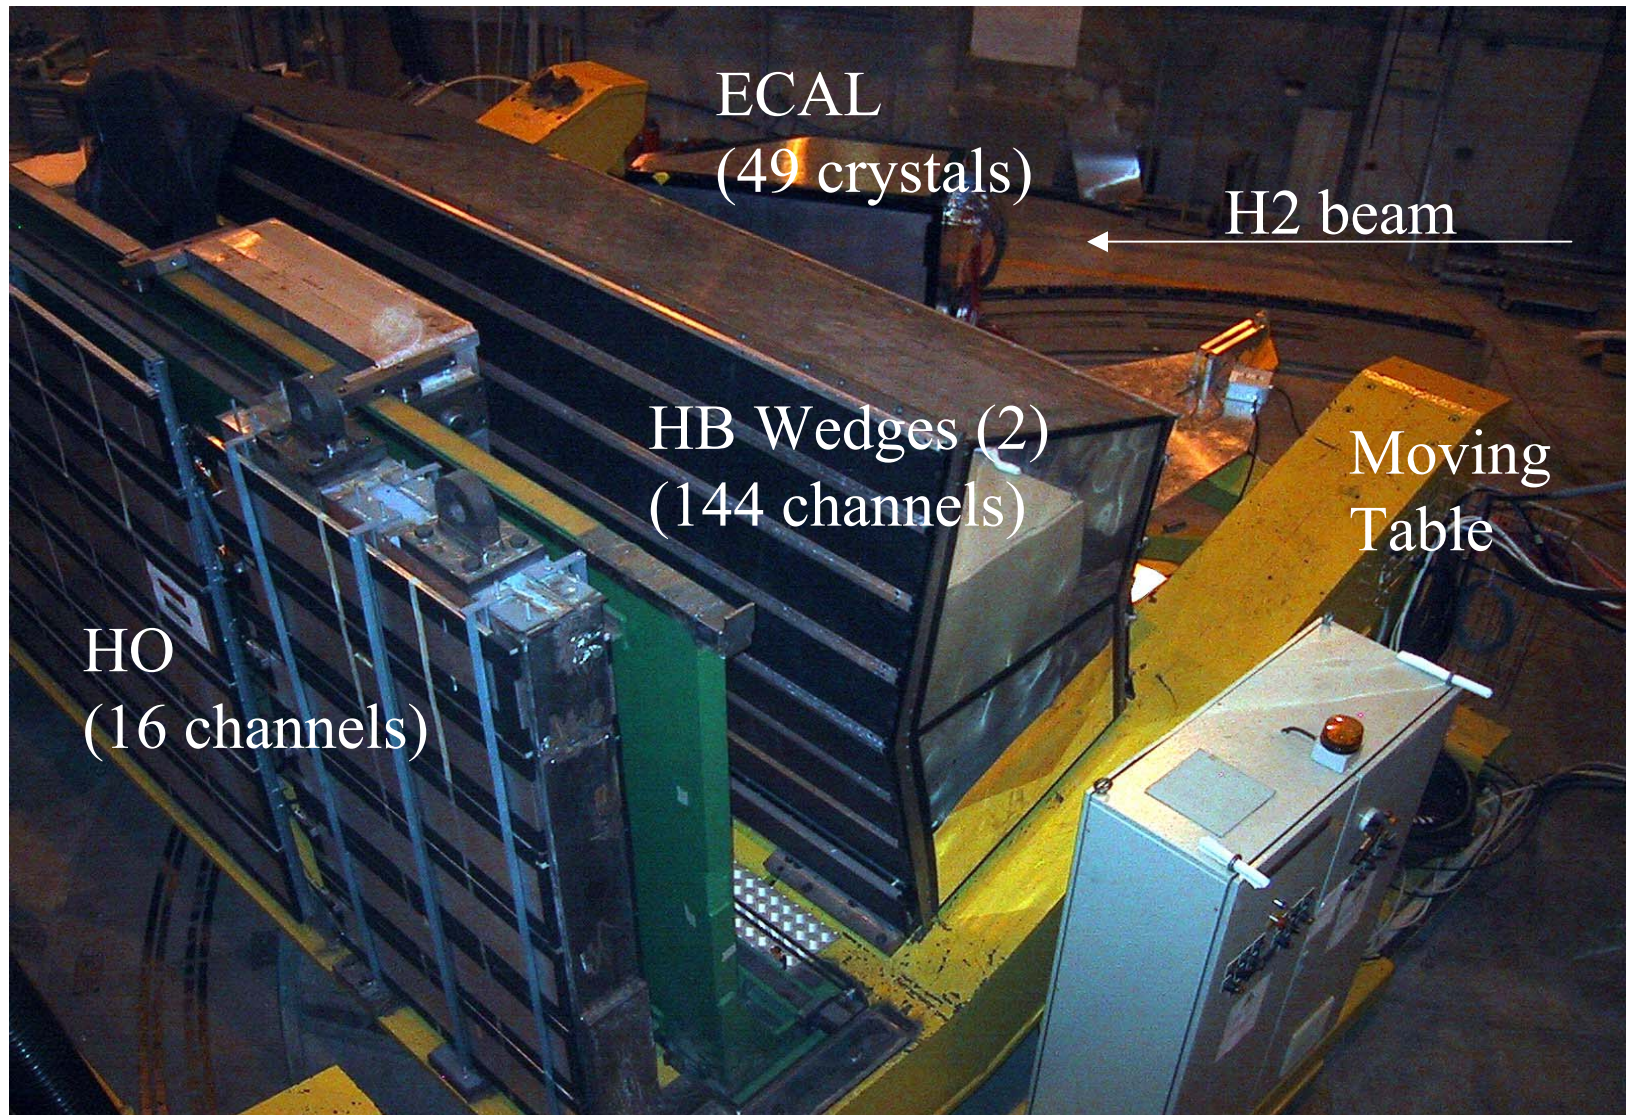

HCAL+"ECAL" Layout

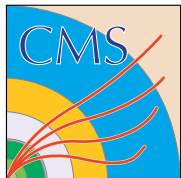

**Calibrate 4
wedges '02.
Check HO
response as
tail catcher
and as
muon
trigger
element. In
'03 use PPP
to study 40
MHz beam
and HE/HB
transition
region.**

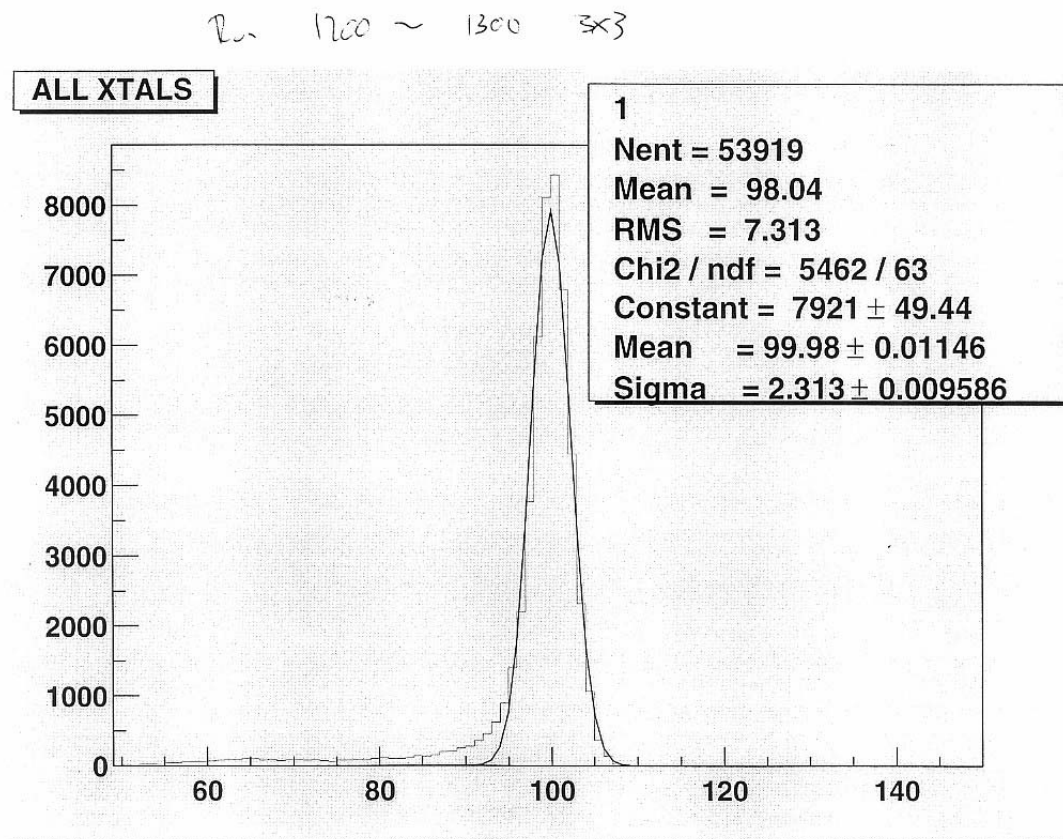

Testbeam Layout

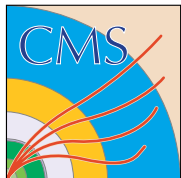

“ECAL”

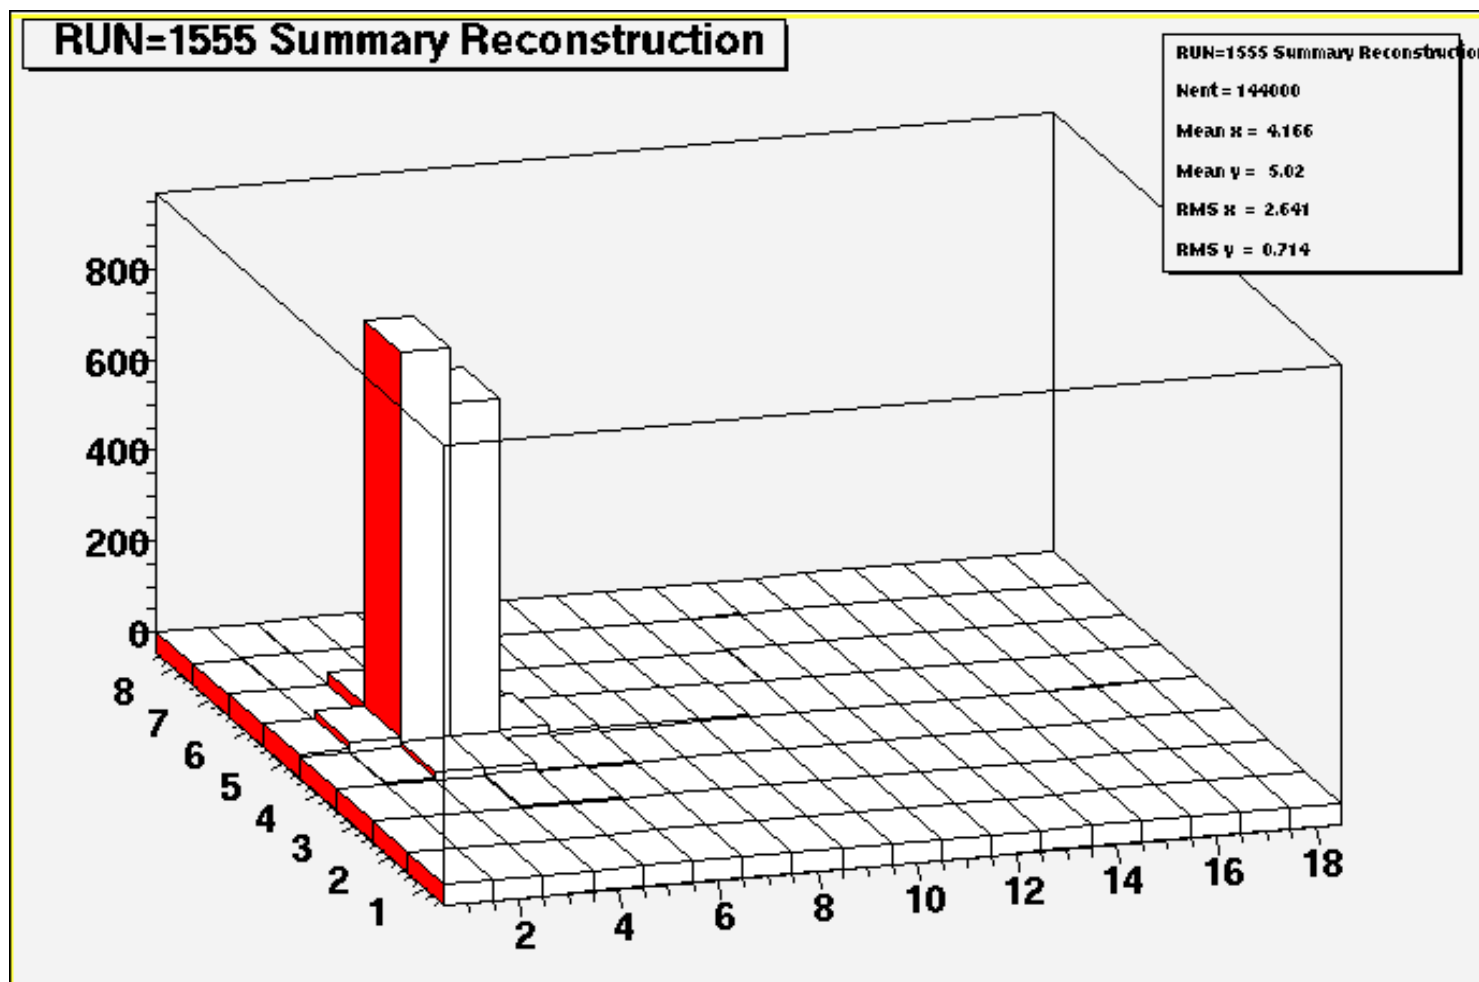

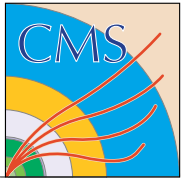

Have a 7 x 7 crystal array in front of HCAL which can be moved for eta scan. Online get a usable resolution of 2.3 %.

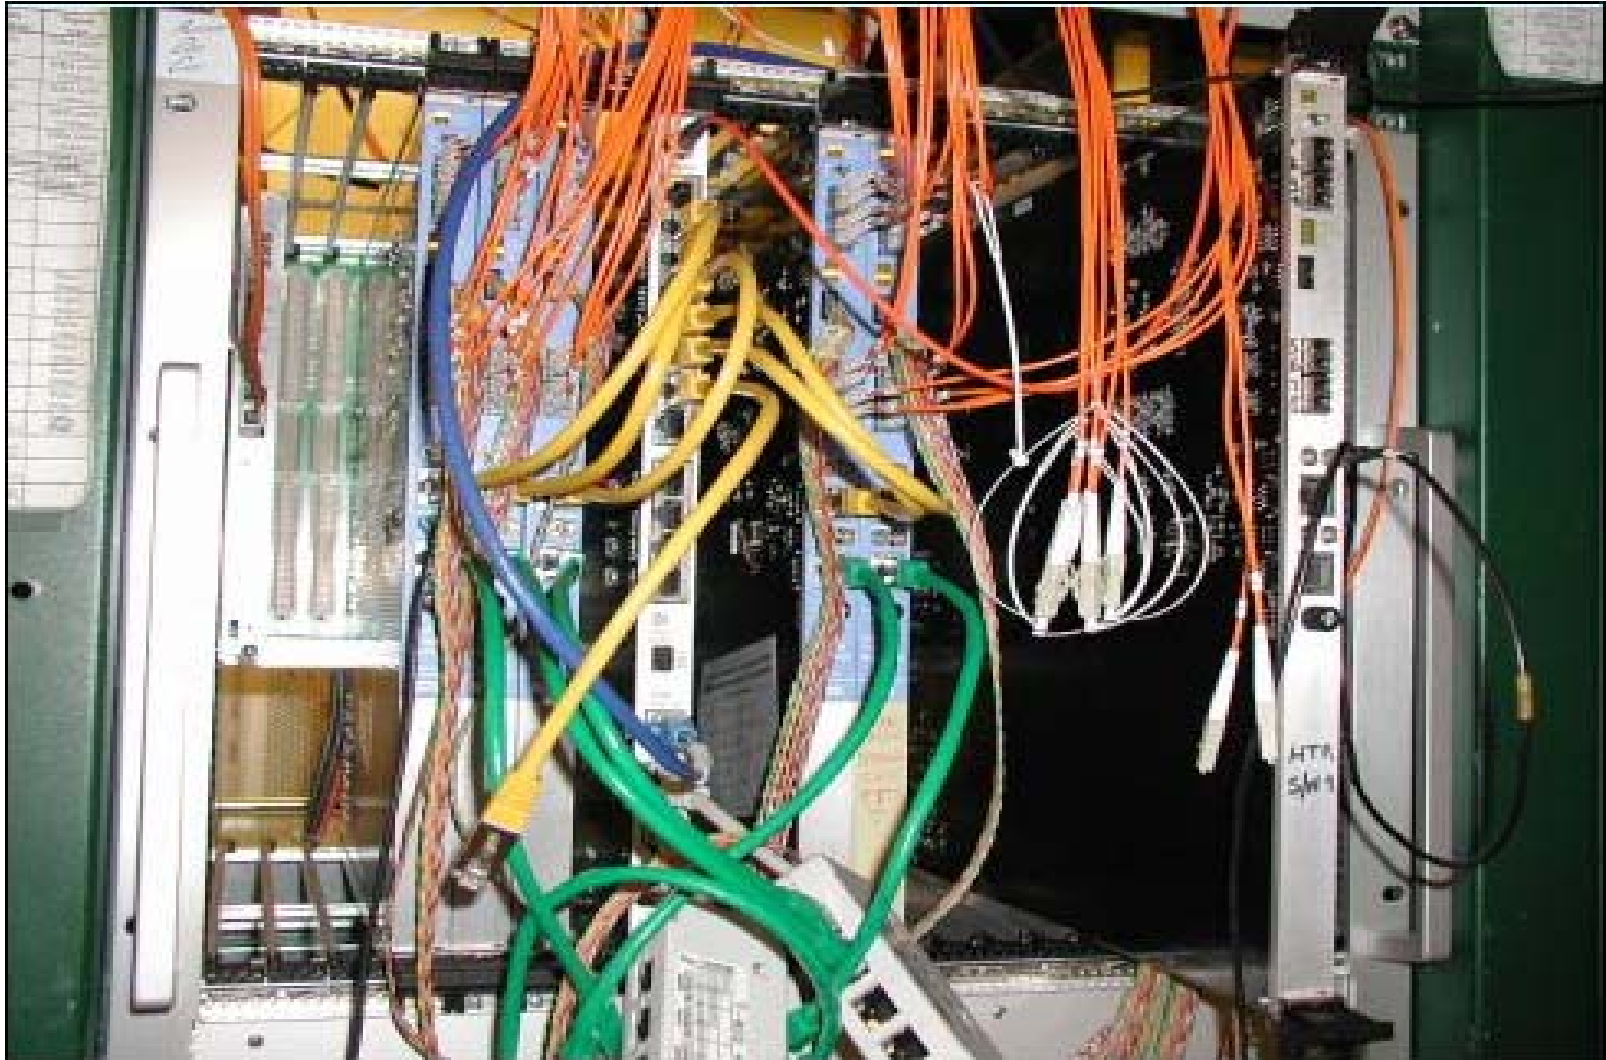

HB 2 Wedges - $16\eta \times 8\phi$

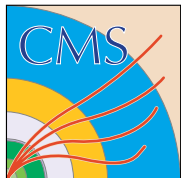

300GeV π^-

Prototype HTR , DCC

Test Beam Results: Data

Radioactive Source	410	16339790
LED Pulser	125	183500
Pedestal	122	594400
Unknown	197	6648177
ECAL Calib (e)	394	6565934
HCAL Histograms	711	10007520
TOR.	3131	101830601

Run Type	Runs	Events
Electron/Positron	783	26467000
Muon	264	10470000
Pion	958	35156200

Data Stream	Runs	Events
HCAL Data	2434	79360547

Wire Chamber Data	2494	84217481
Phase Data	2497	84218081
HCAL Histograms	411	16367520

Runs: 3131

Spills: 53991

Events: 101830601

μ^-	225 GeV
e^-	100, 20, 30, 50 GeV
π^-	300, 20, 30, 50 GeV

Run Statistics as of Wed Sep 18 21:00:02 2002

Data and Software

Data Files

- ROOT format
- All files (~300GB) are in the tape robots at CERN and Fermilab.

Software for Analyses

- HTBDAQ_data
 - http://flywheel.princeton.edu/~jmmans/HTBDAQ_data/
 - Provides data access methods to DAQ root files
- Simple C++/root scripts to analyze data.
 - e.g. wire source analysis
- H2Reco
 - <http://home.fnal.gov/~jdamgov/h2reco/>
 - Reads DAQ root file using HTBDAQ_data.
 - Construct higher level objects, e.g. 1x1, 3x3, 5x5 ECAL or HCAL clusters in addition to raw ECAL and HCAL data, etc.
 - Writes output root files
 - V11 was used for quick data validation during September runs.
 - V12 includes calibration by the wire source data and “phase” calculated with energy weighted time slice.
 - Most of runs have been processed through V12 at Fermilab..

System Problems

In consistent QIE calibration constants.

- Calibration constants from Fermilab did not match to actual QIE response at TB.

Multi TeV events

- Corruption of QIE data for a few events to >500 events.

CapID rotation error.

- CapID should rotate 0-1-2-3-0-1-2..., but not.

Drift of pedestals in beam and source modes.

- Pedestal split for different CapID.

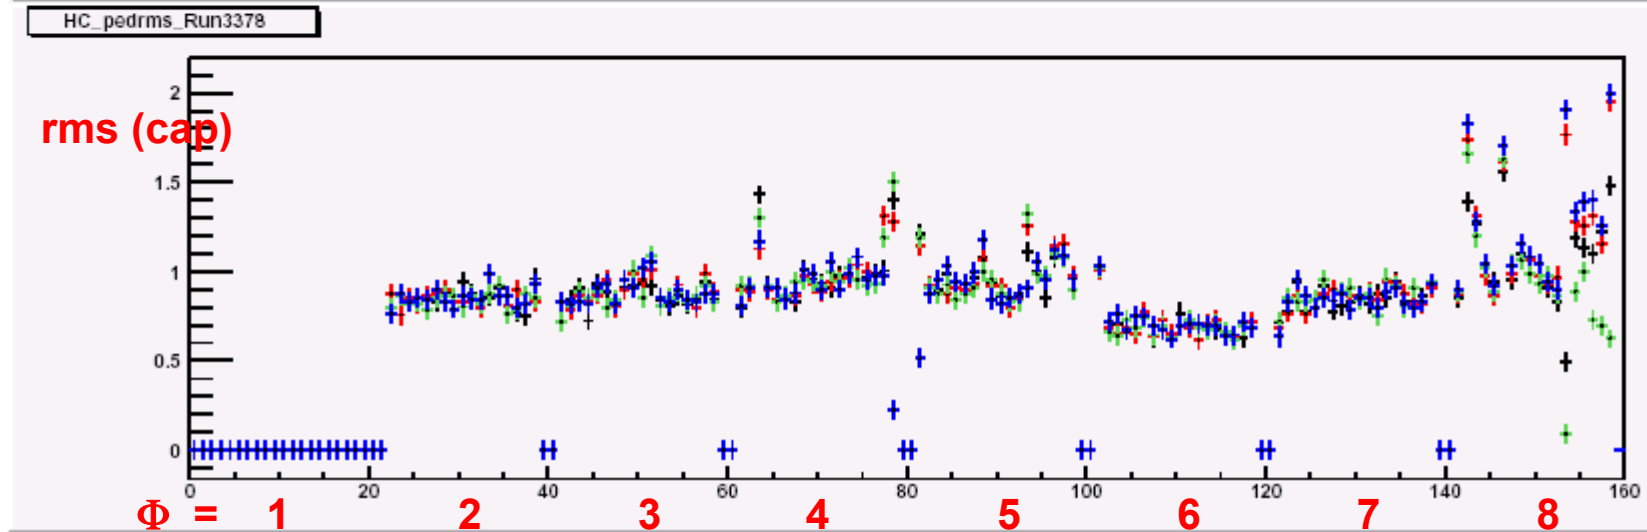

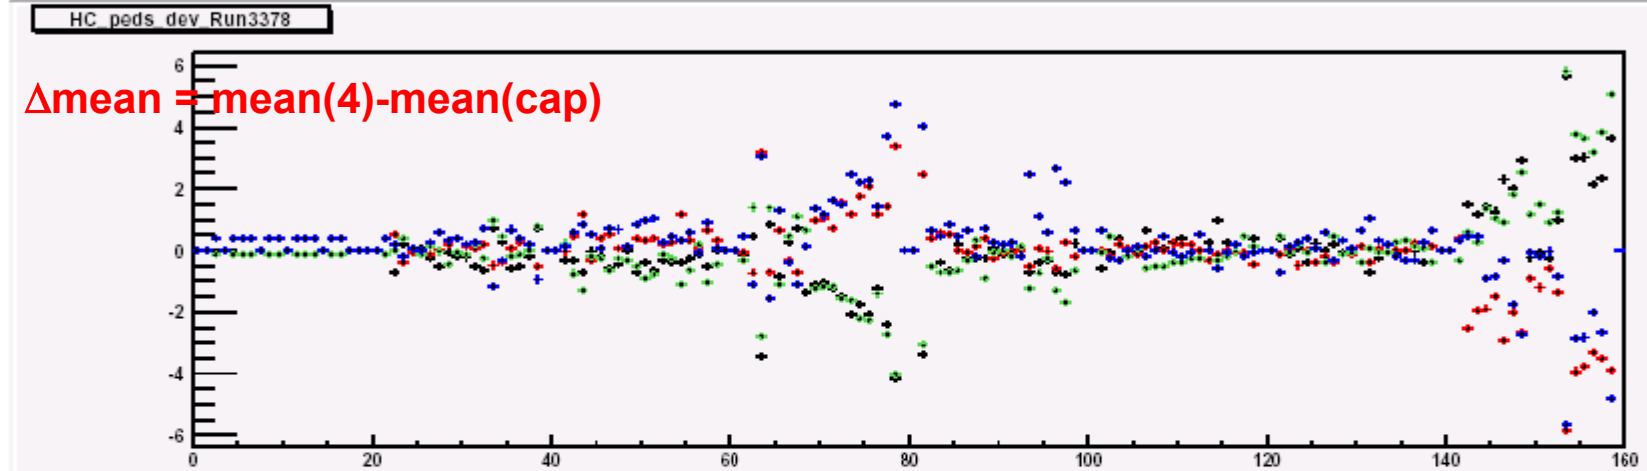

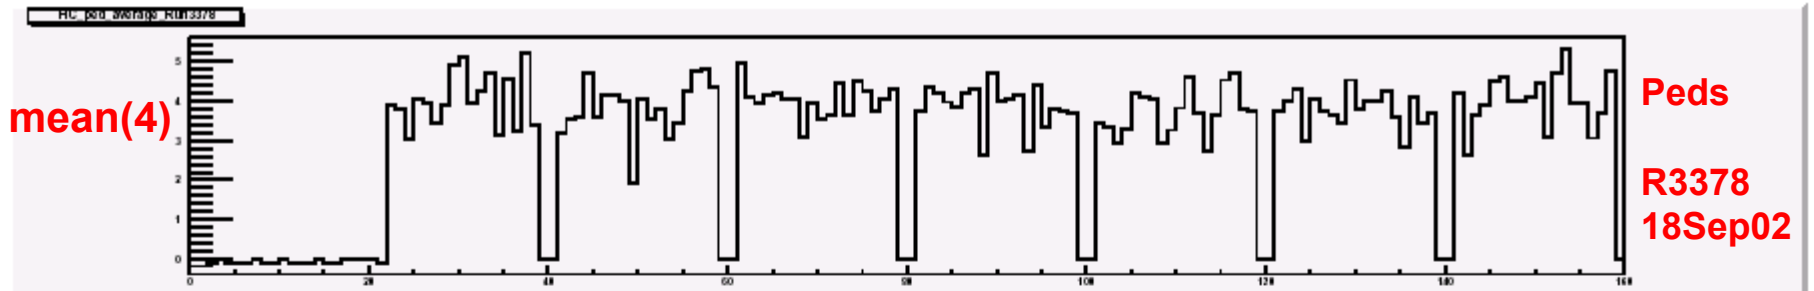

HTR event number increment error.

Jitter in TDC measurement

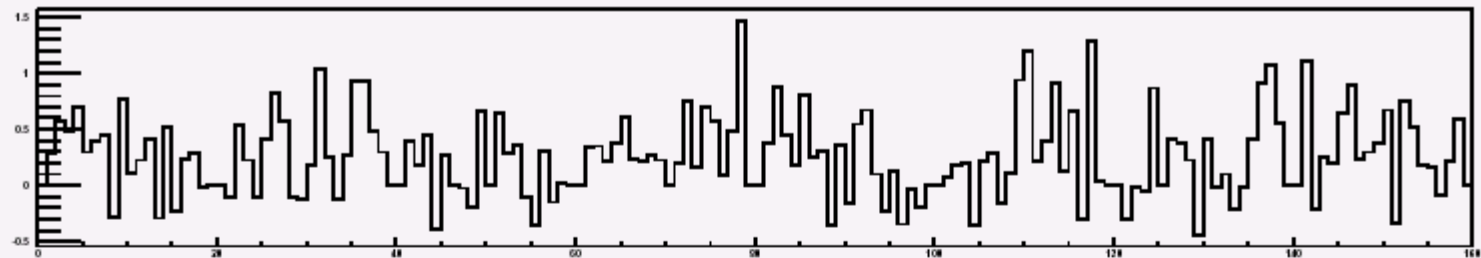

- for Phase and Wire chamber. – false alarm???

Pedestals

HC_ped_avg30_Run806

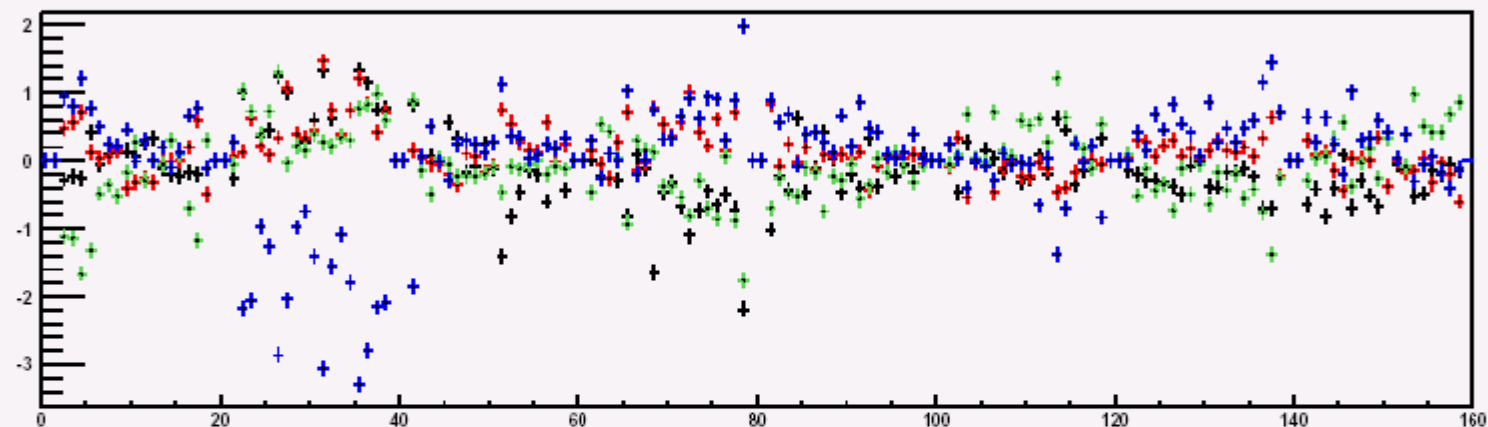

Peds

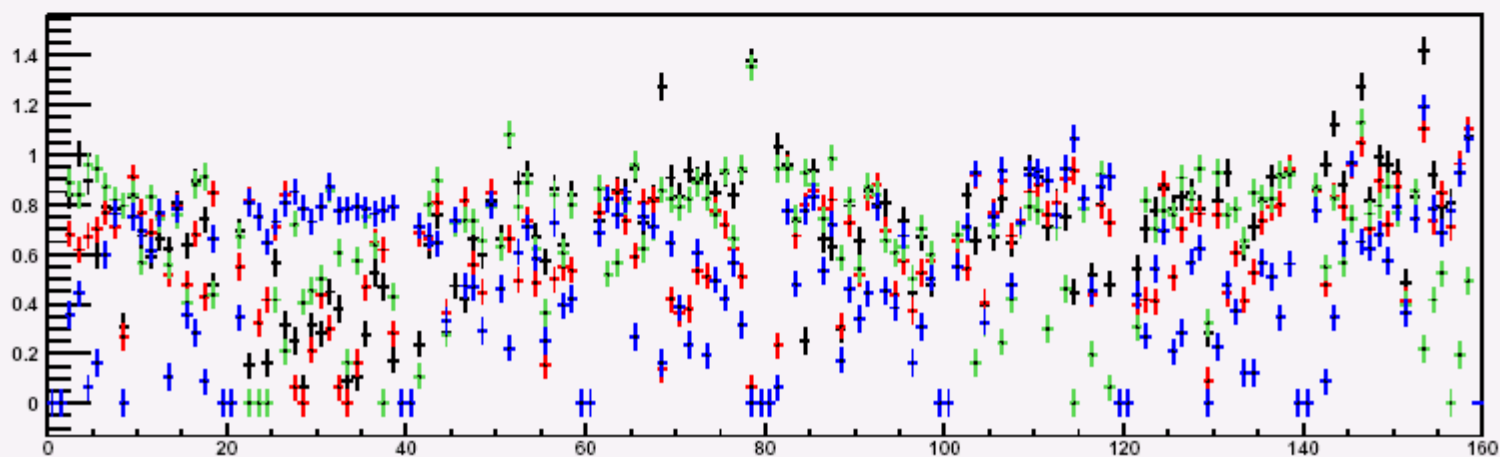

R806

9Aug02

HC_peds_dev_Run806

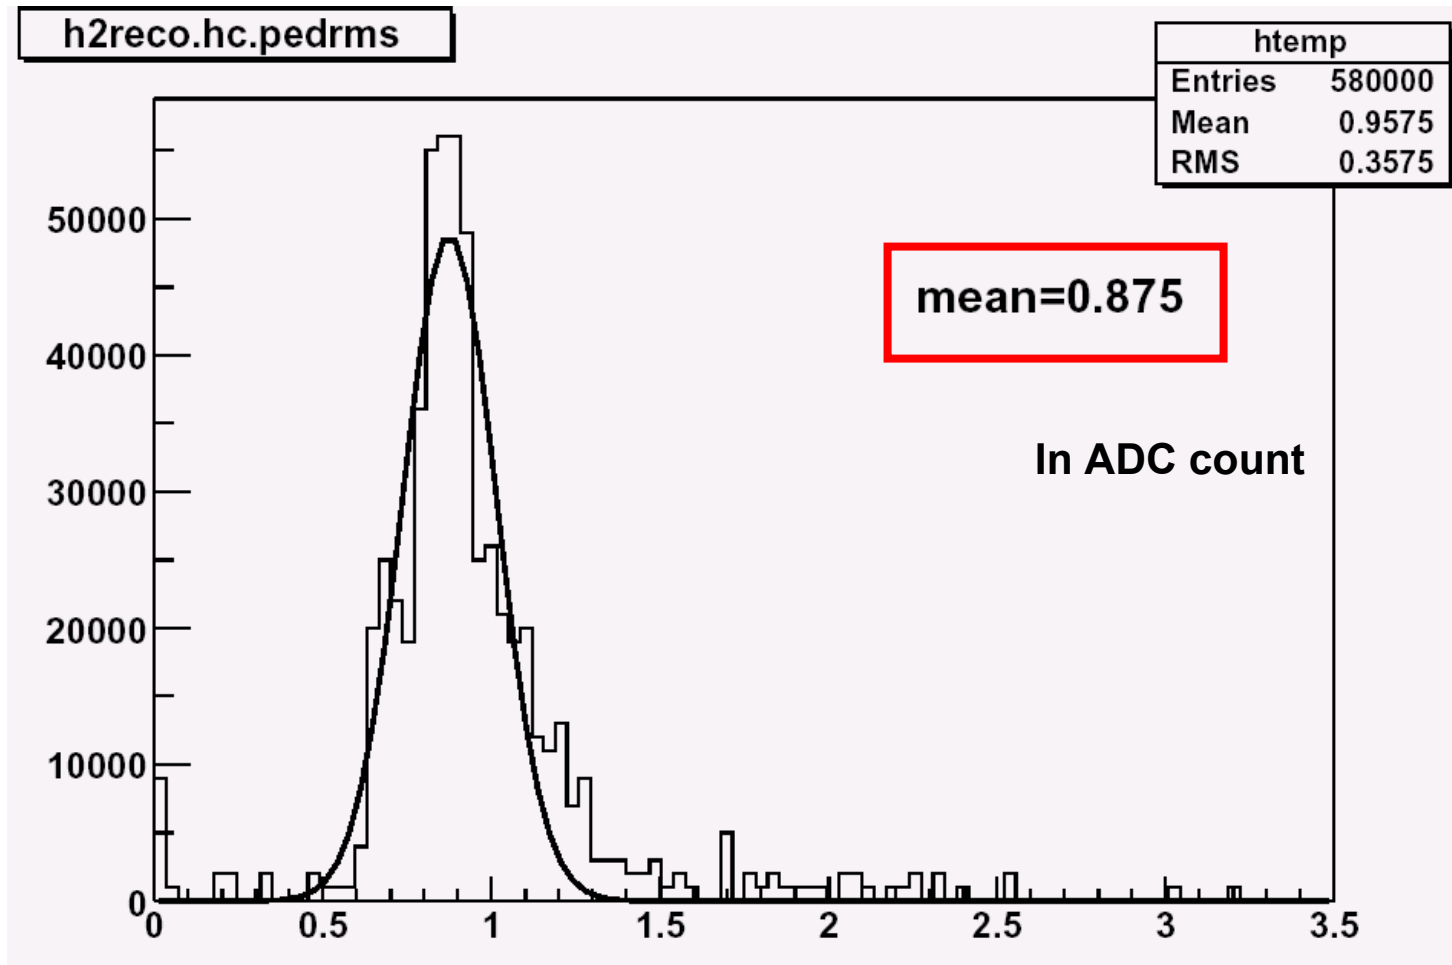

HC_pedrms_Run806

Noise Level

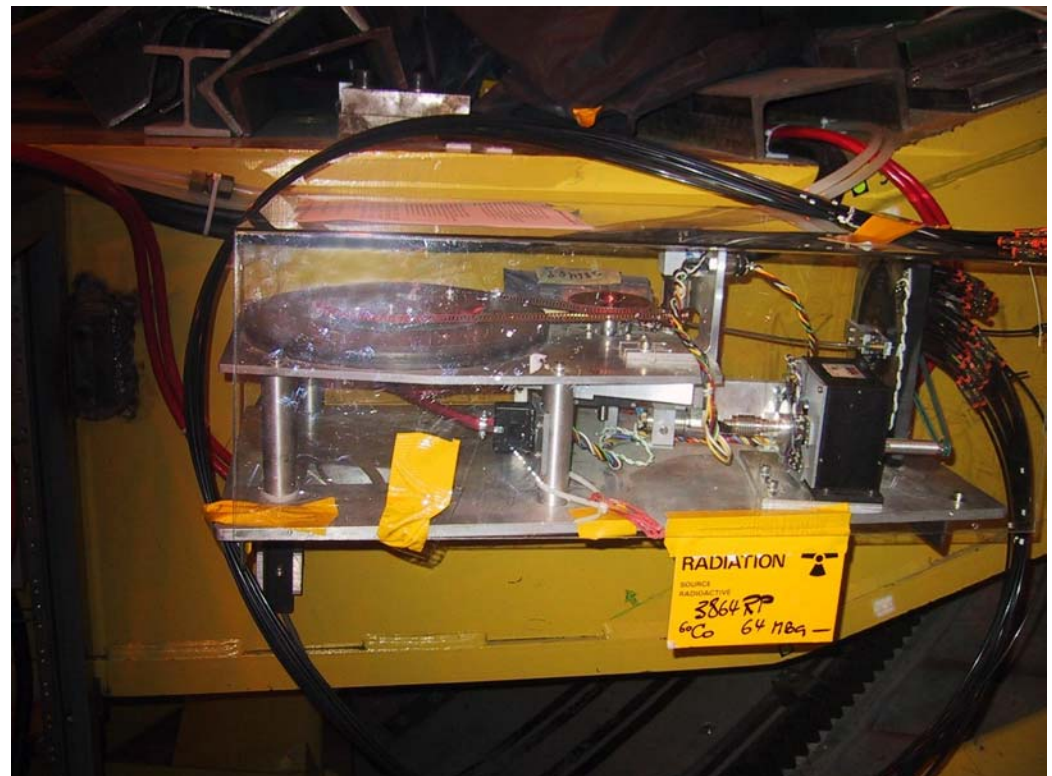

Pedestal RMS distribution

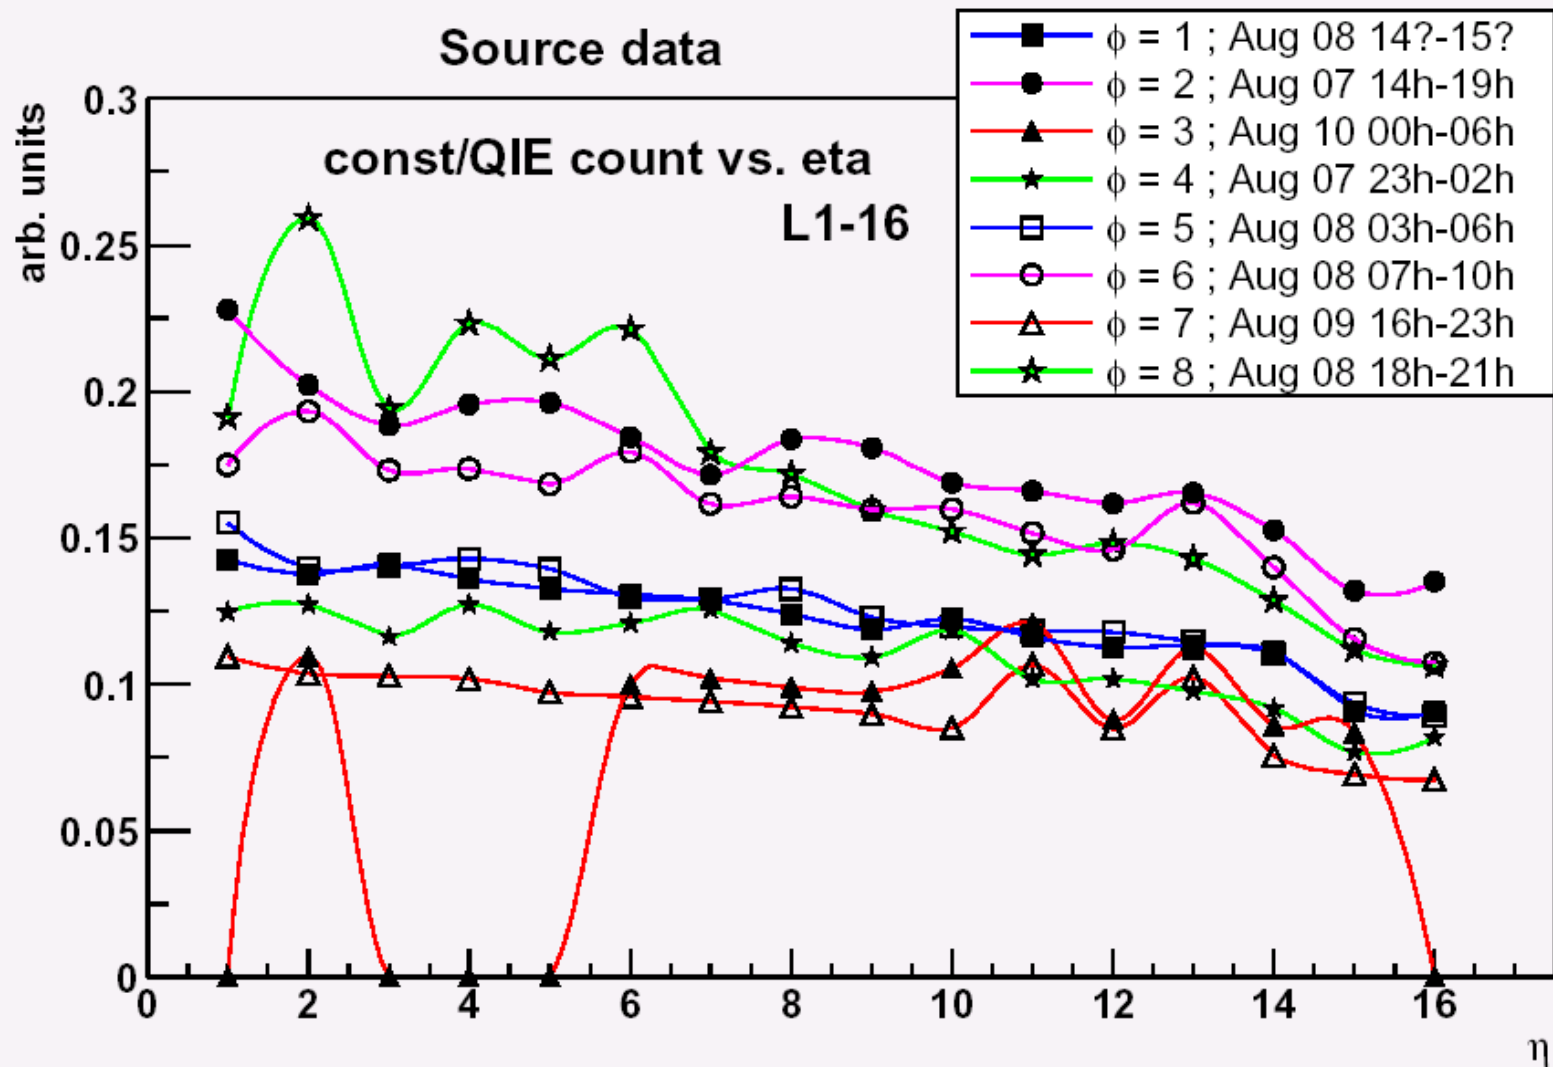

Source scan uses QIE at 25 nsec to sum up to a D.C. current. Signal to noise is good (3 mCu). Assignment of calibration constant to tile is simple.

Wire Source Scan

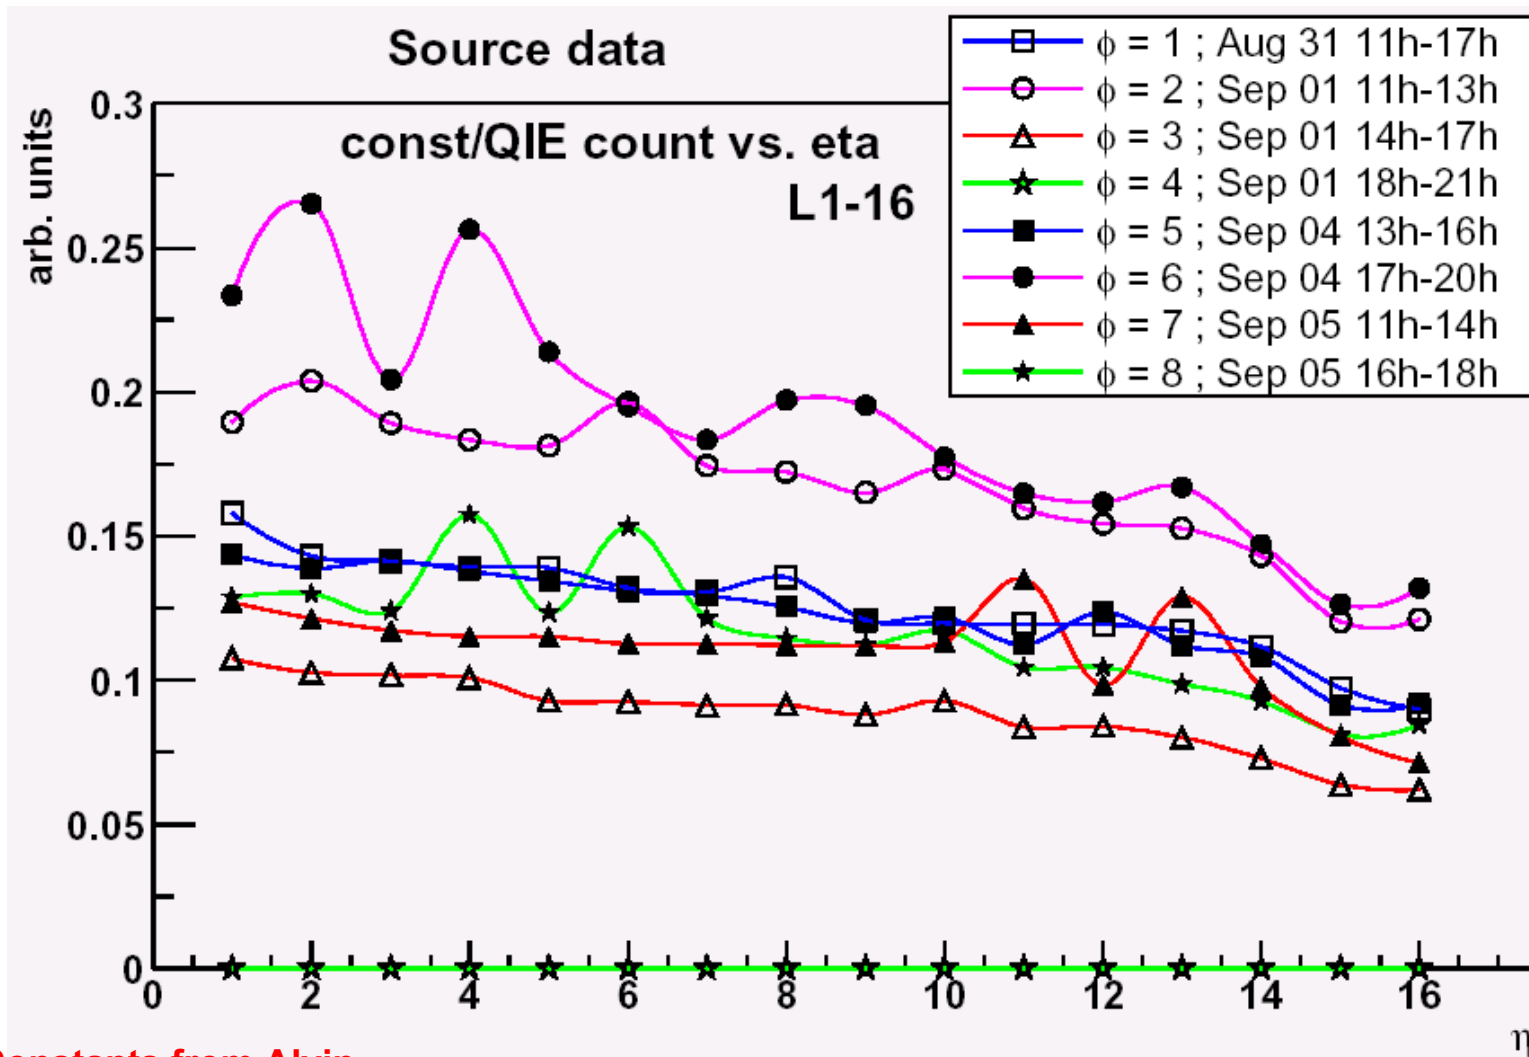

Wire Source (Aug. run)

Constants from Alvin

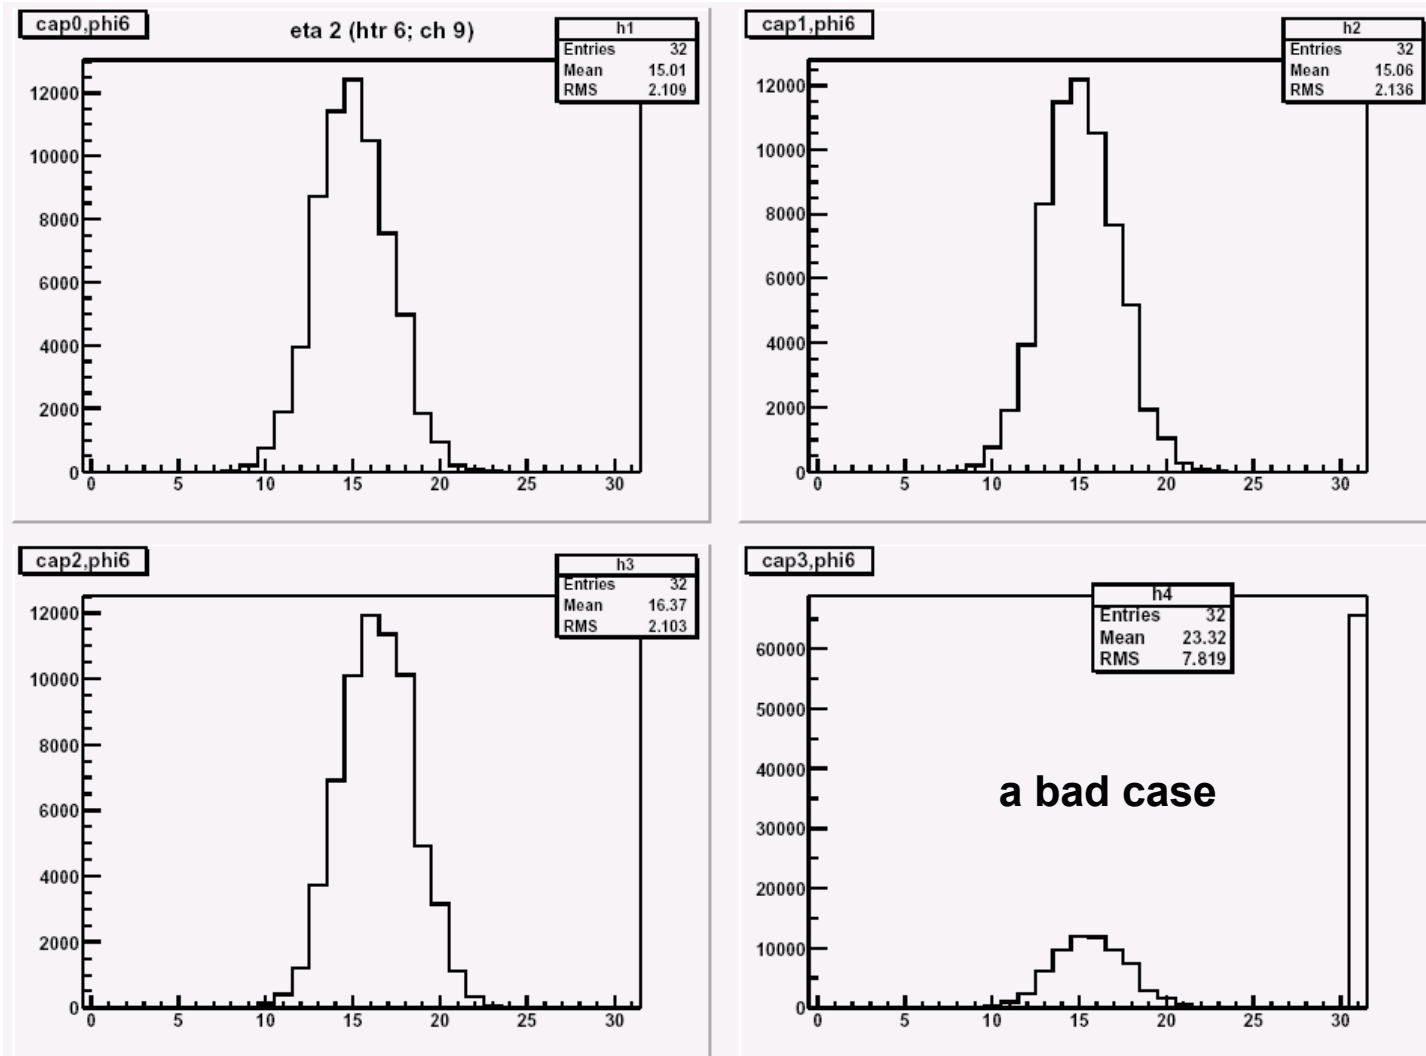

Wire Source (Sep. run)

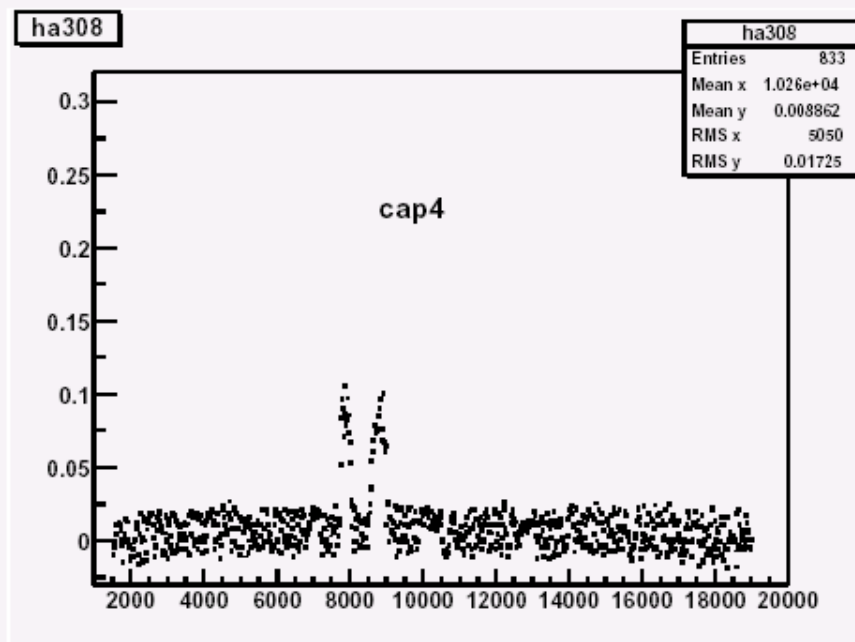

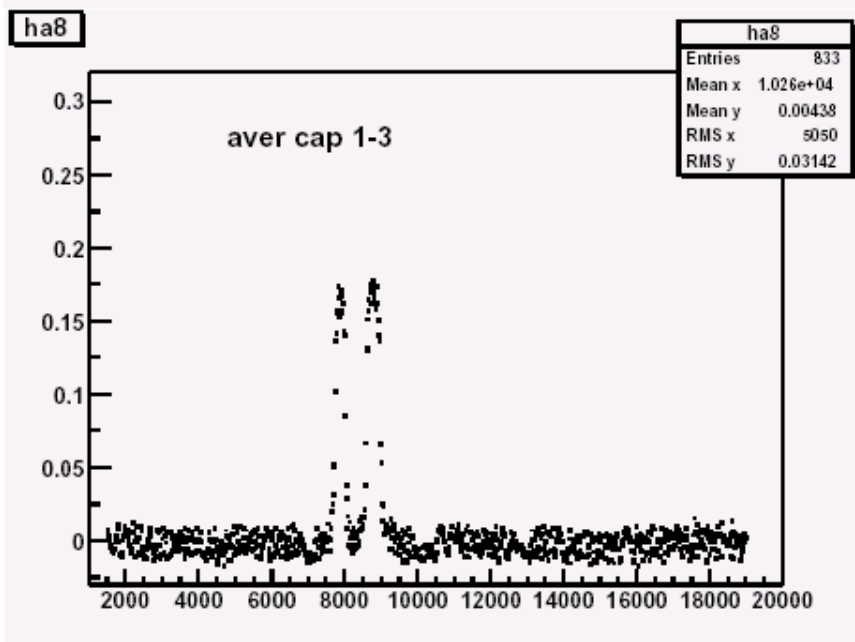

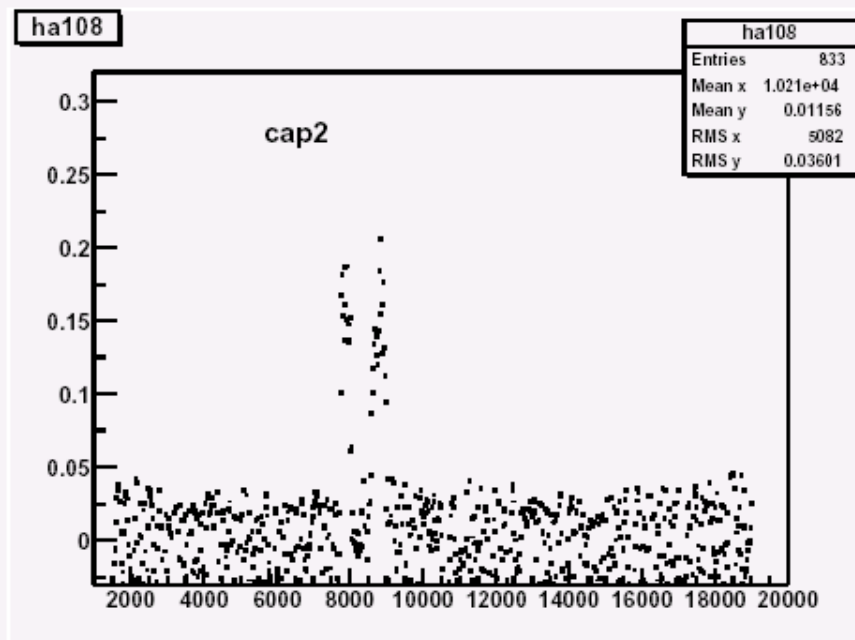

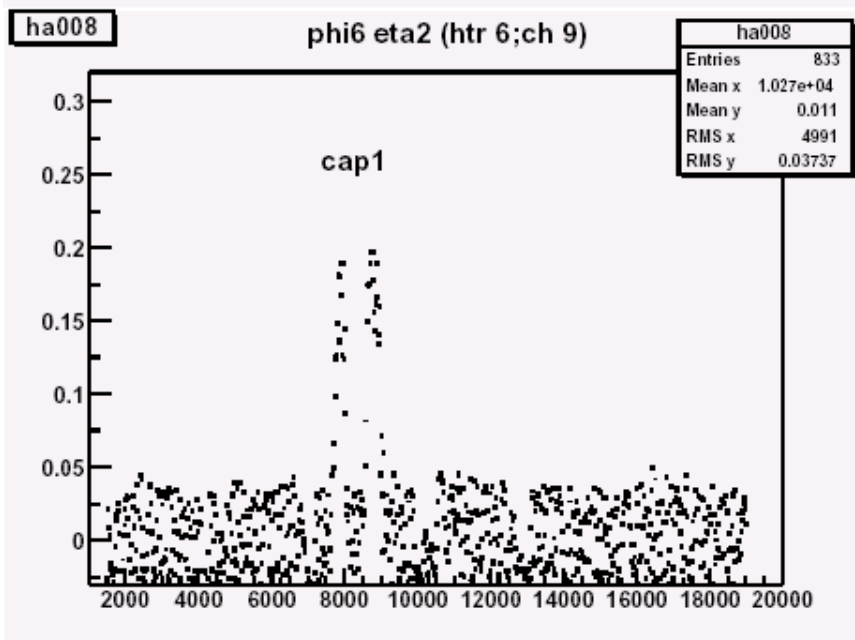

Constants from Alvin

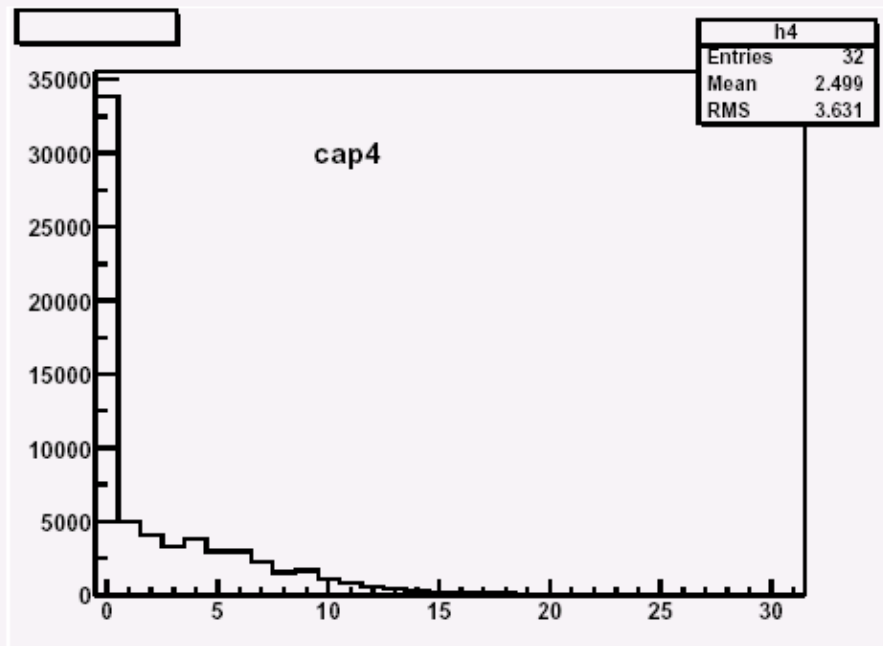

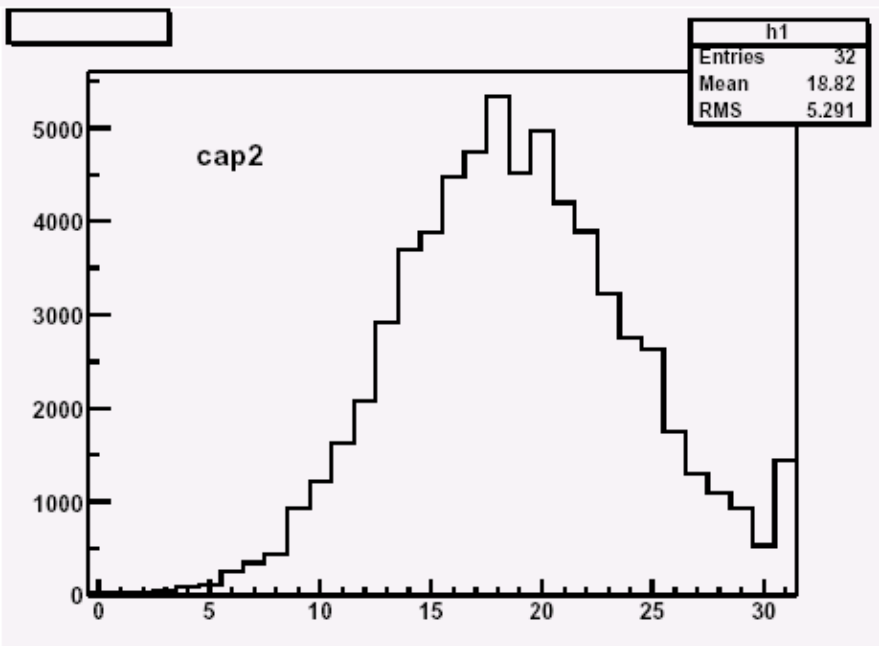

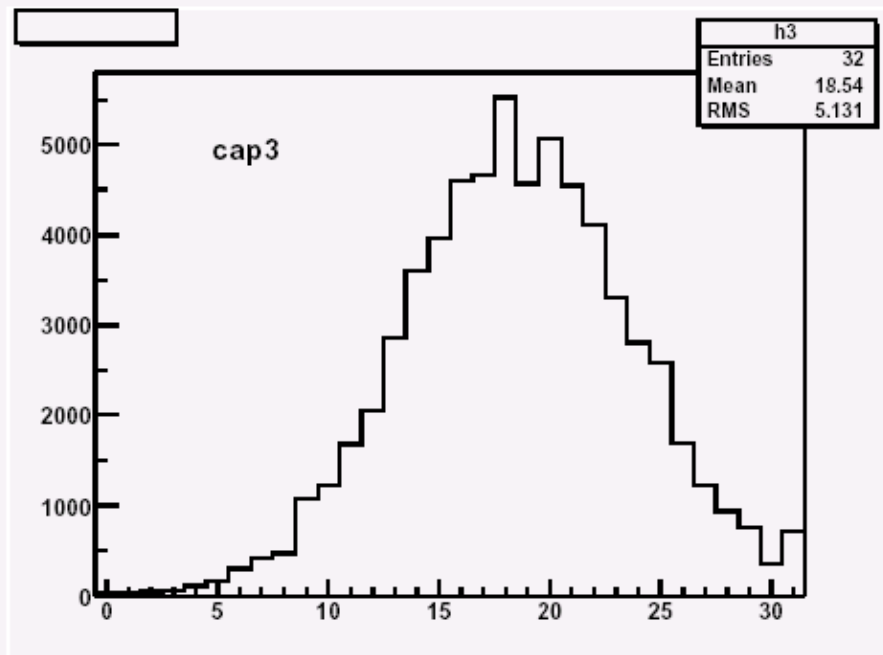

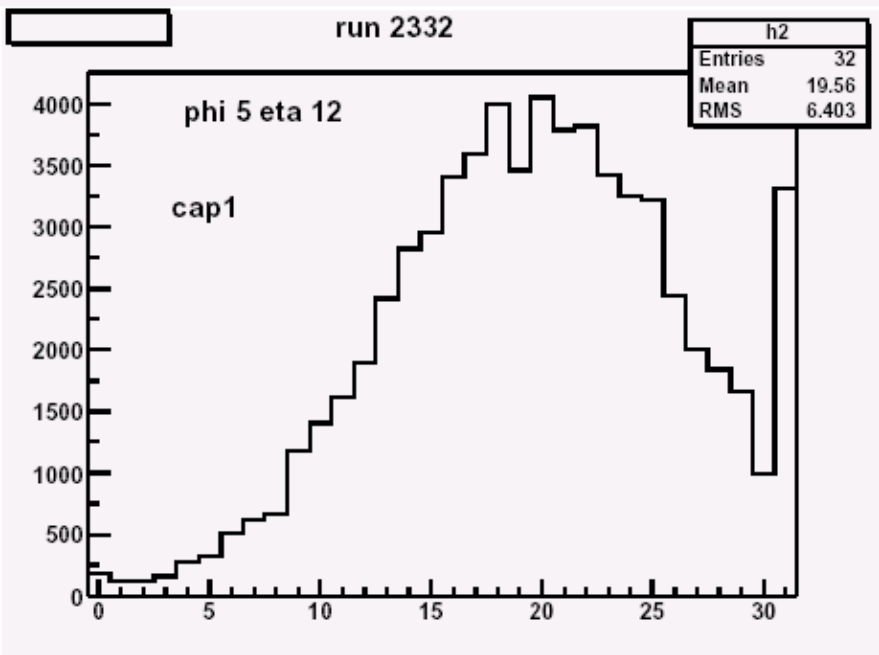

Source Histograms by HTR

ADC count (in 3x mode)

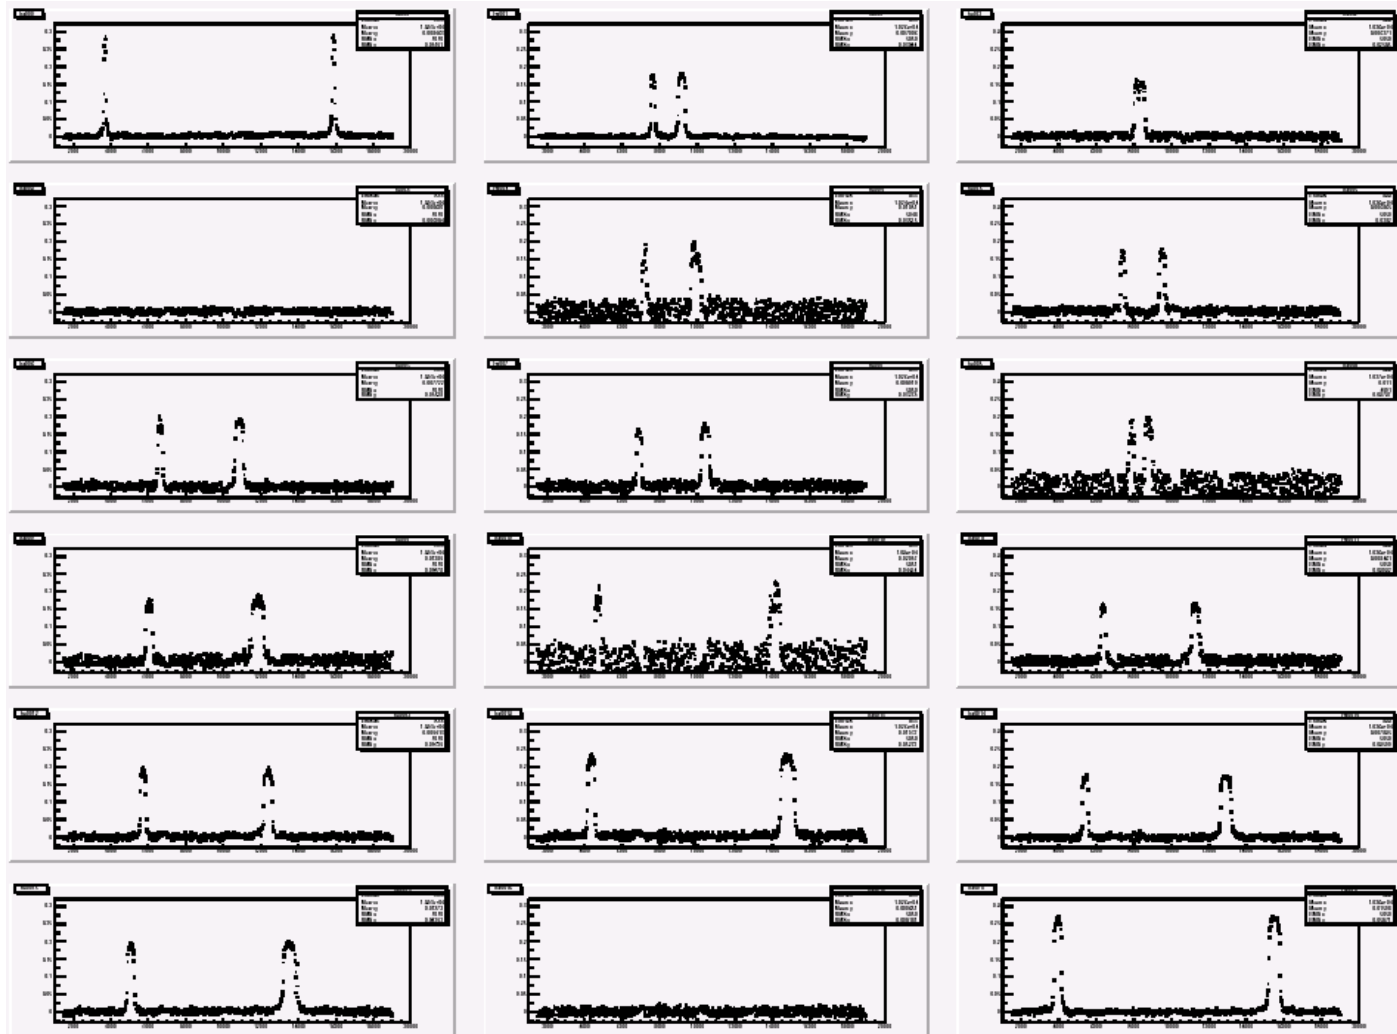

Wire Source

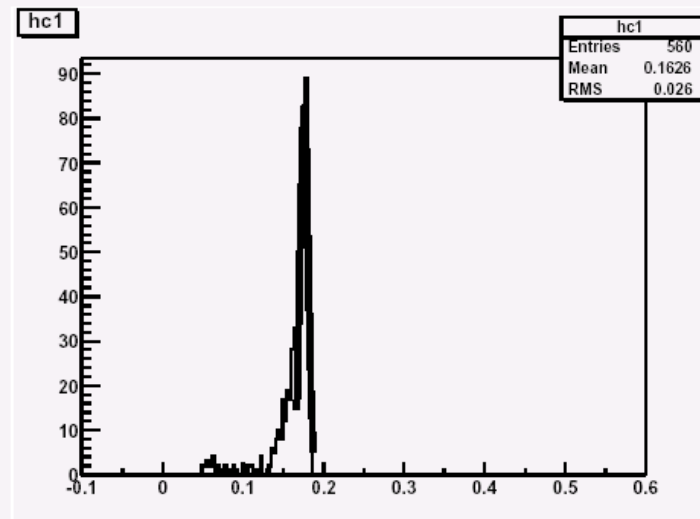

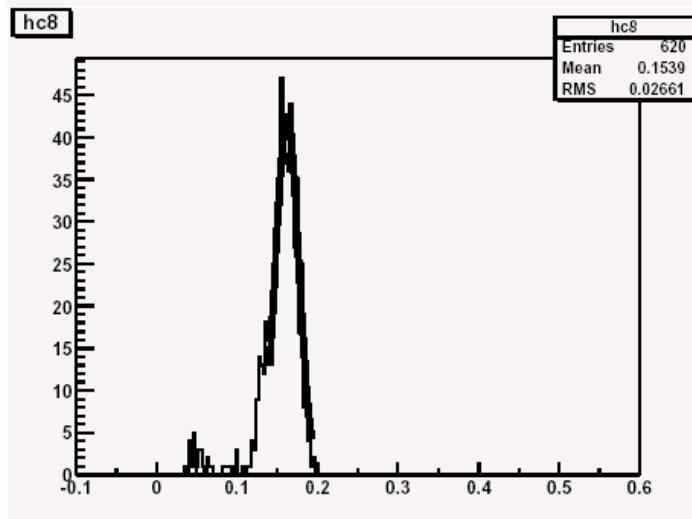

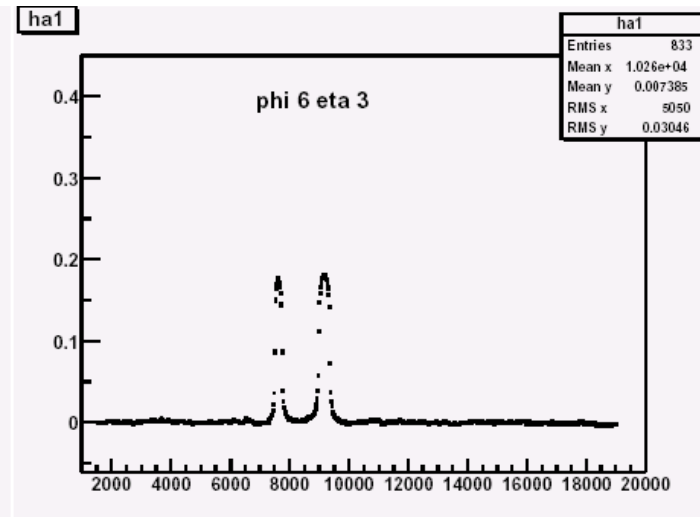

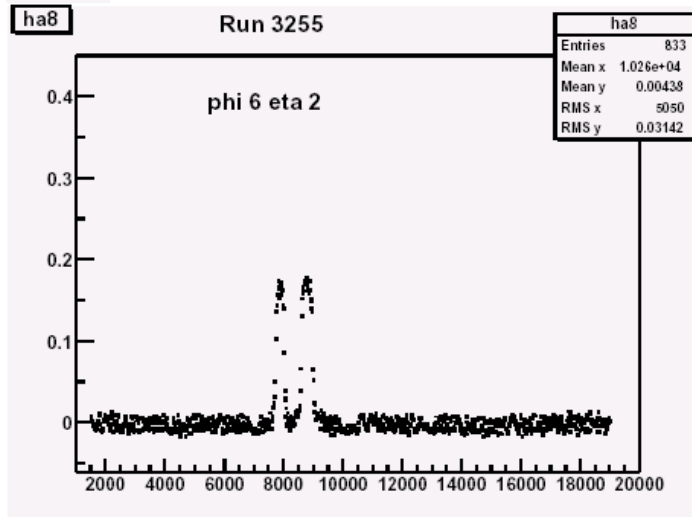

each point – gaussian fit to histograms

Some channels are noisier than others.

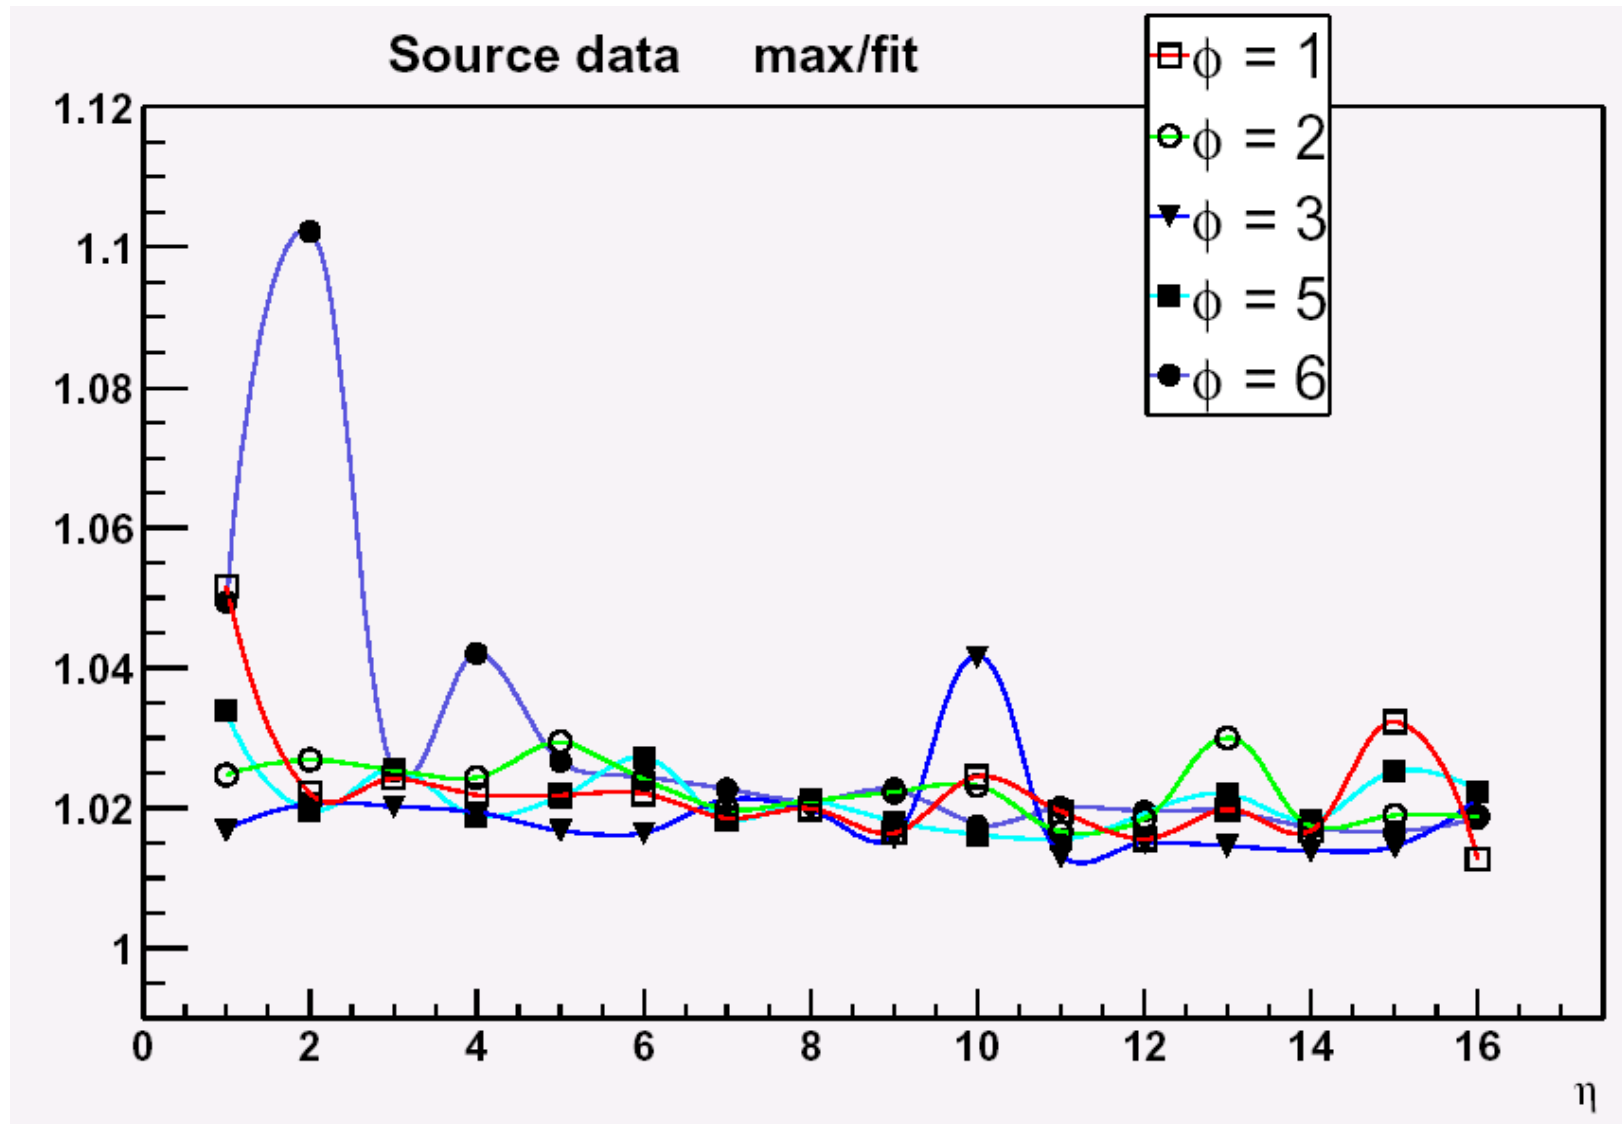

Gaussian Fit to y projection

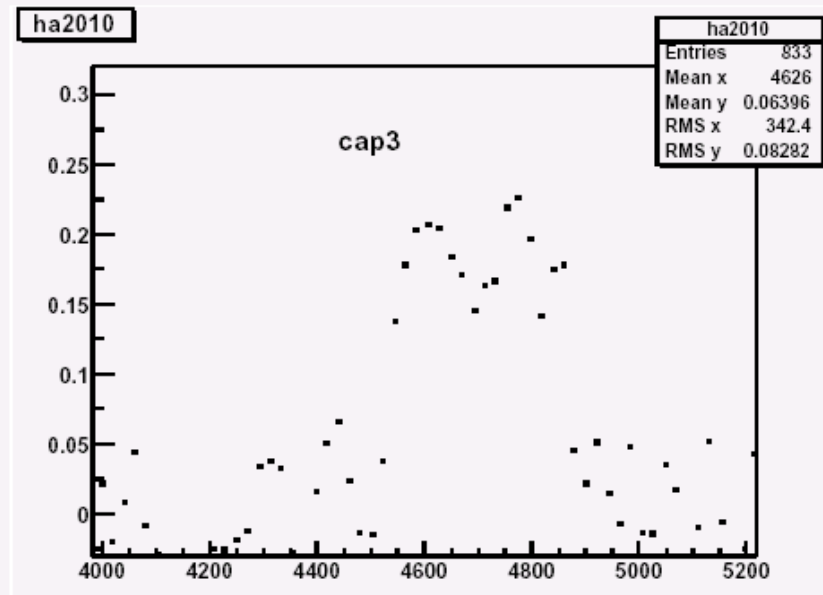

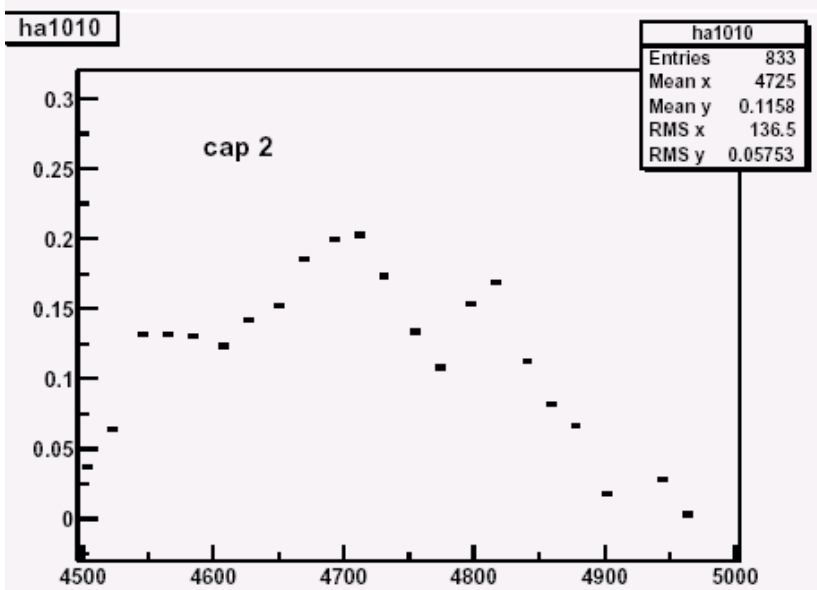

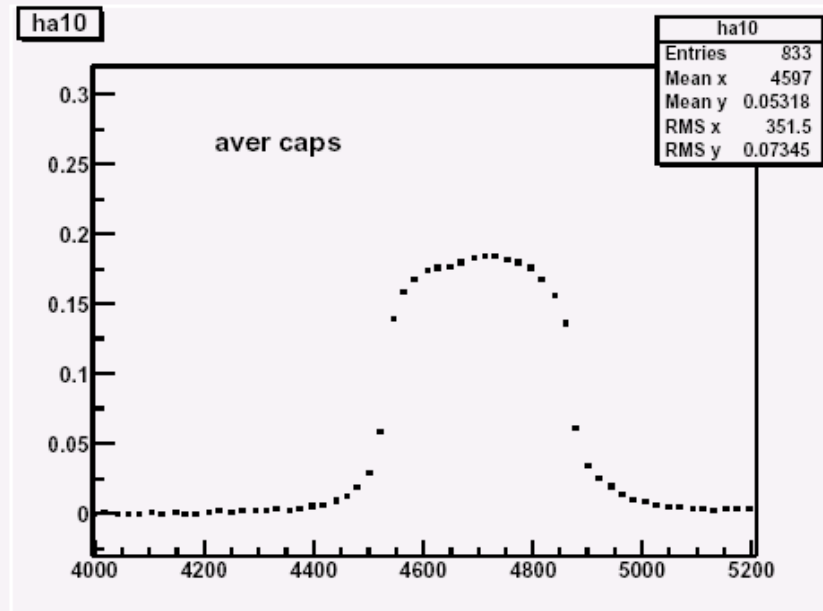

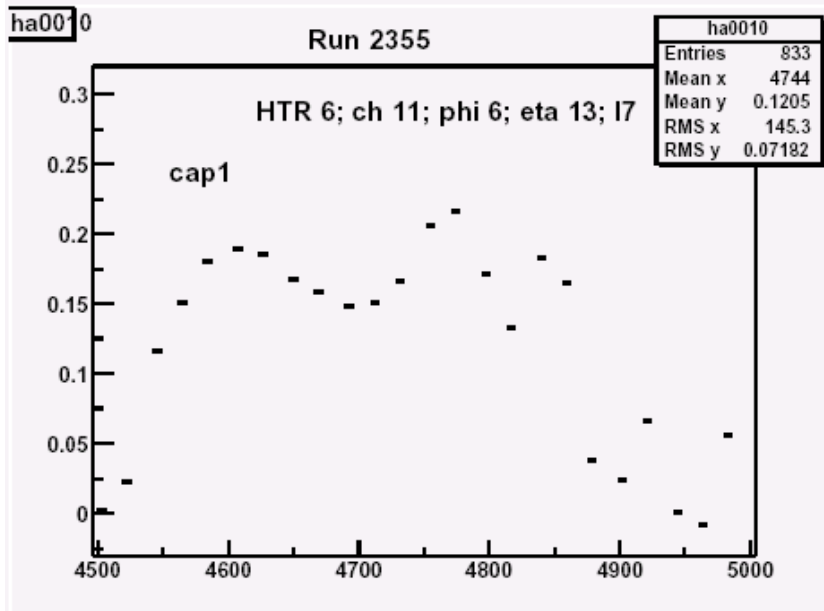

Fitted values are less sensitive to pedestal width.

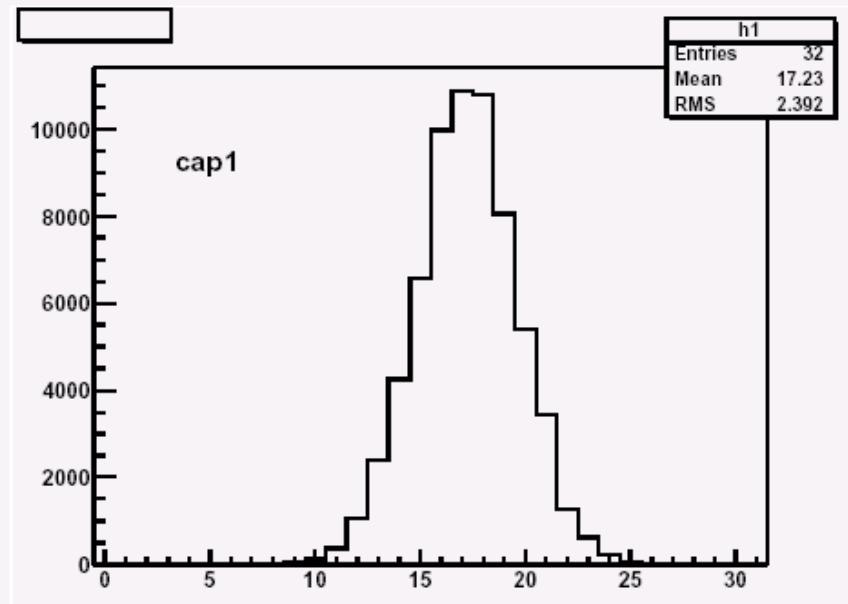

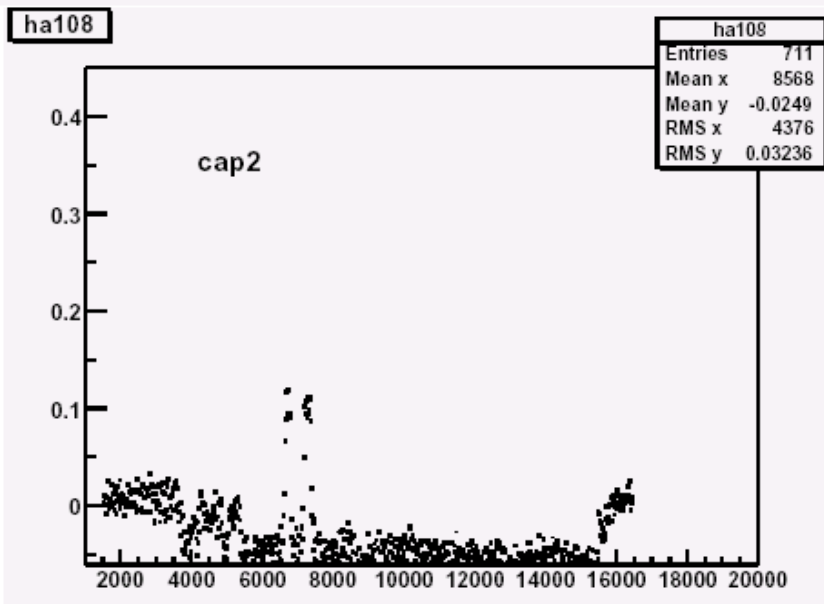

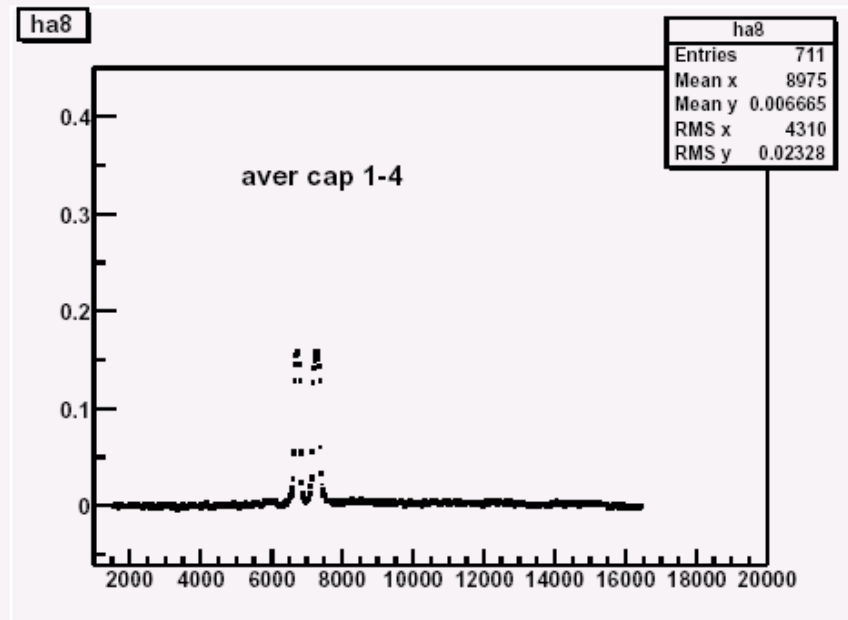

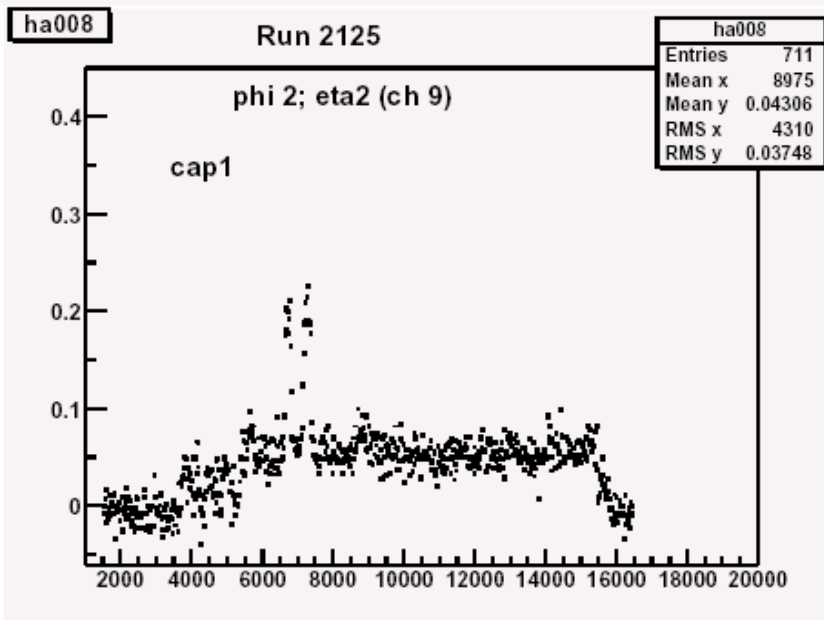

Max vs Fit

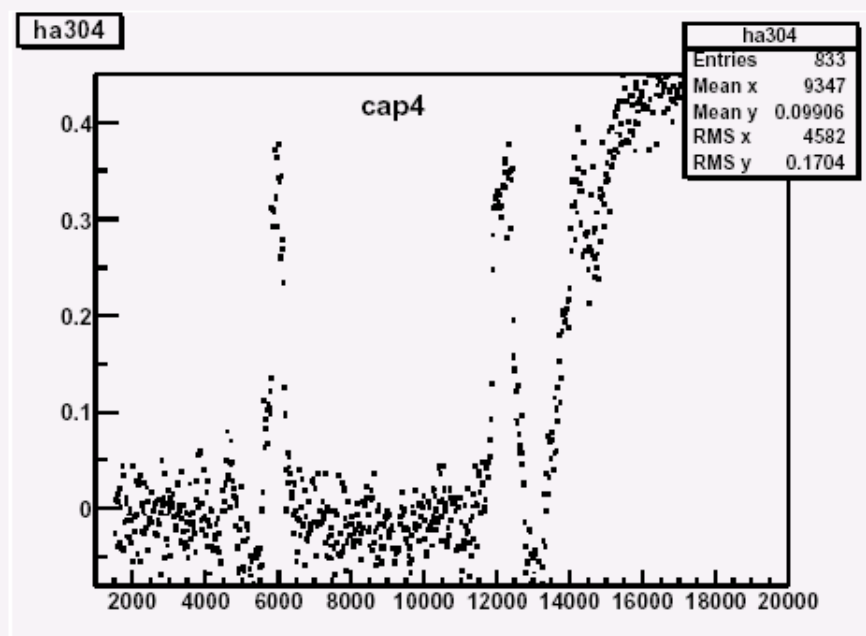

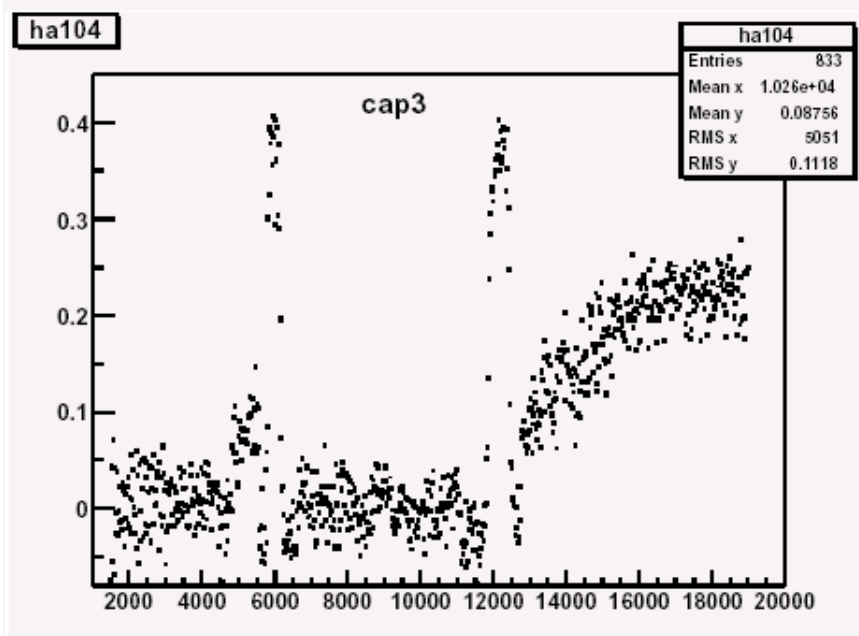

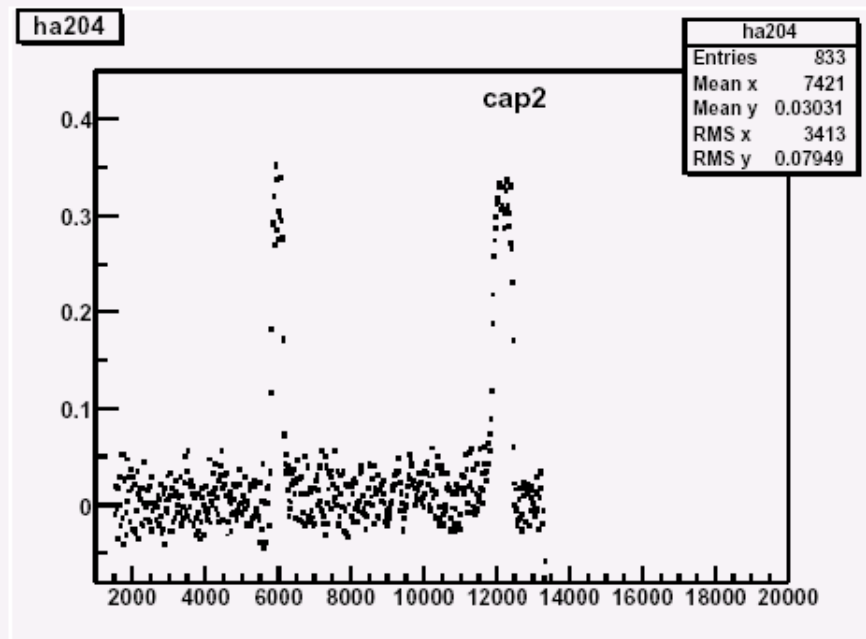

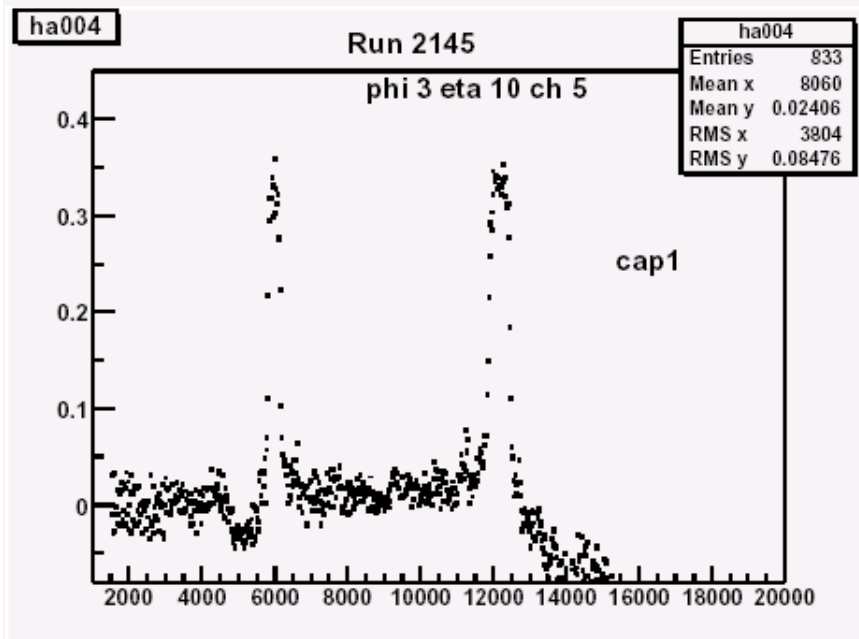

Calibration constants for individual CapID are useless.

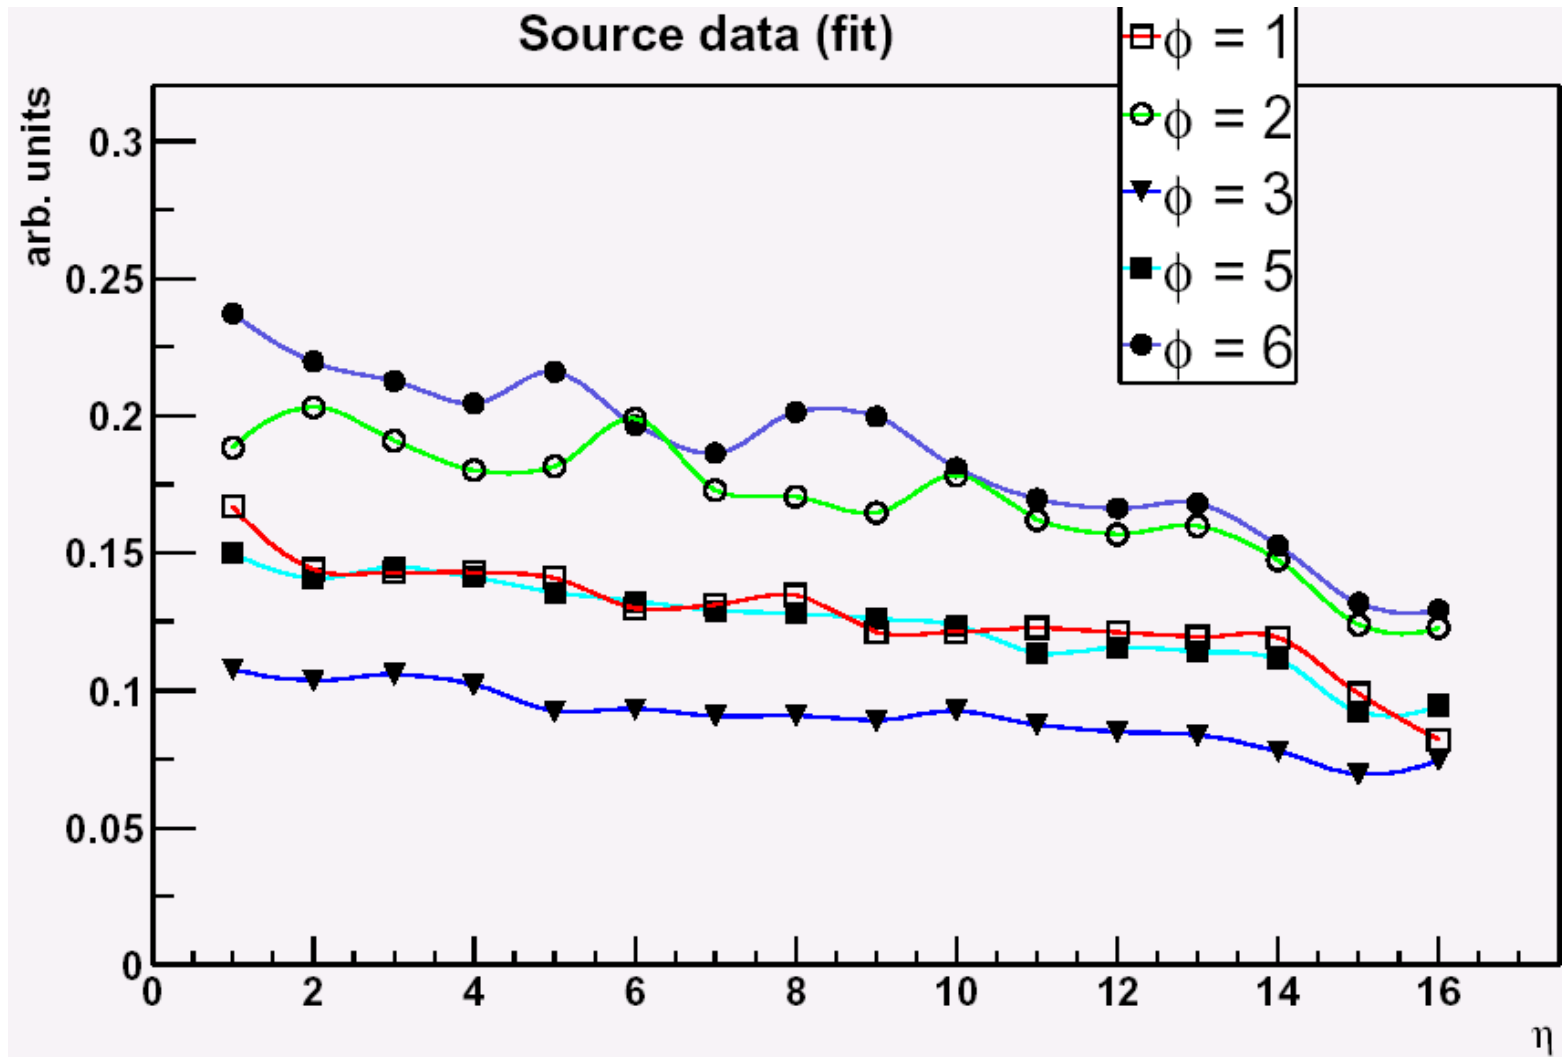

Peds drifted during the run.

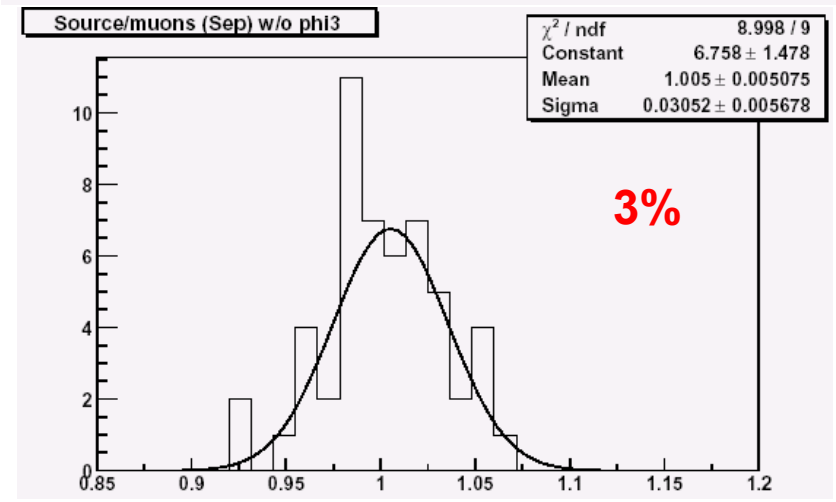

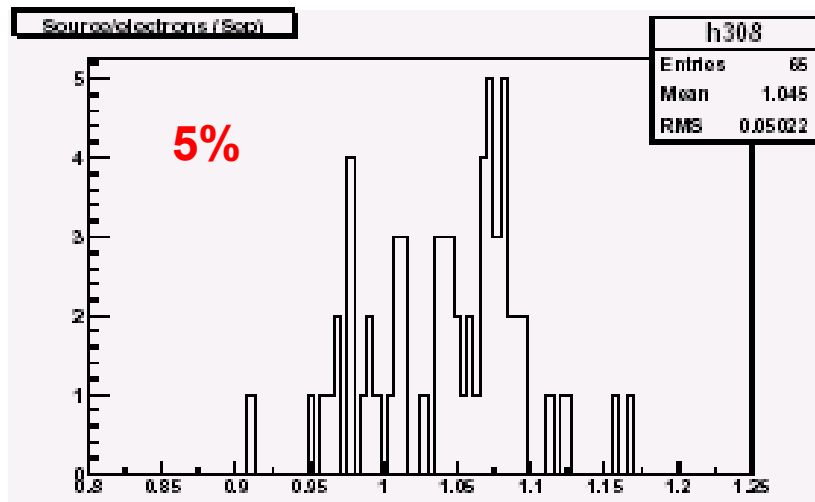

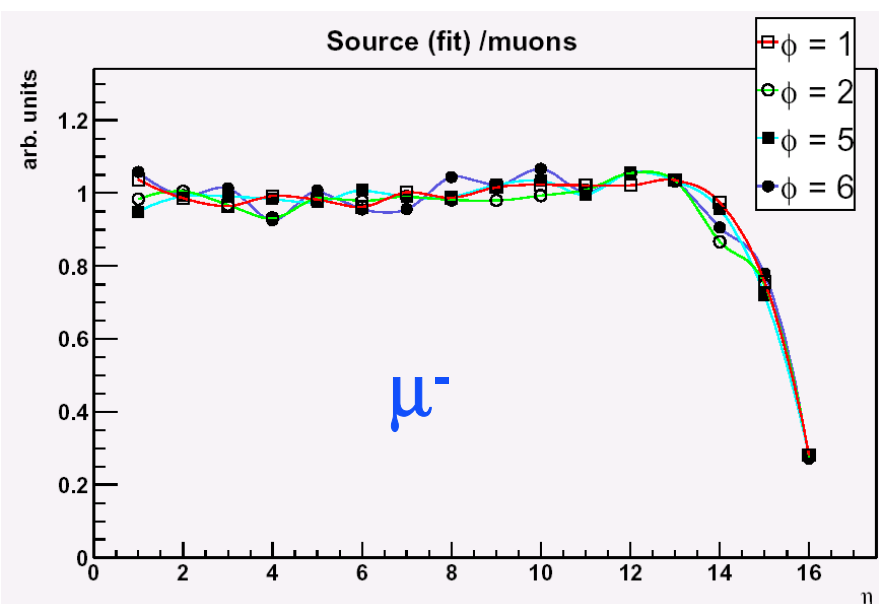

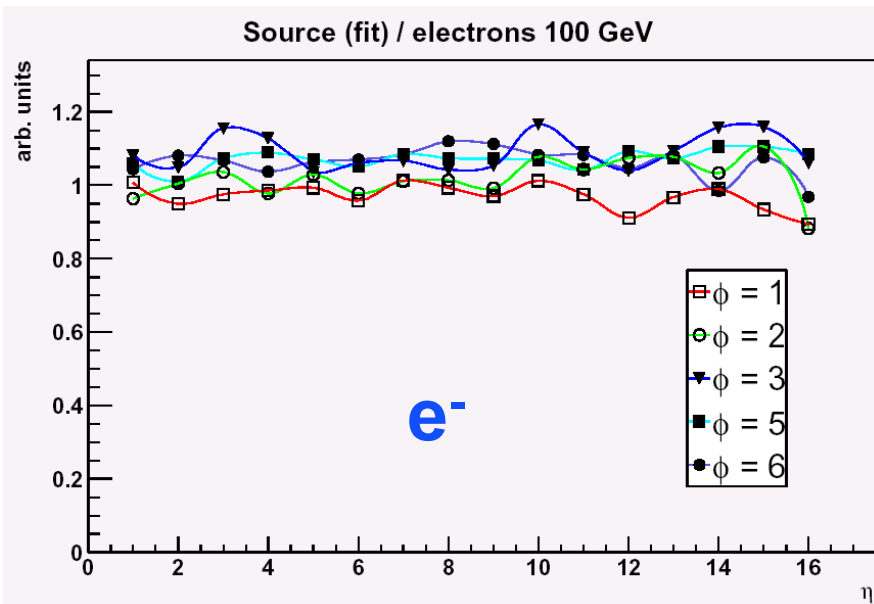

Wire Source Data

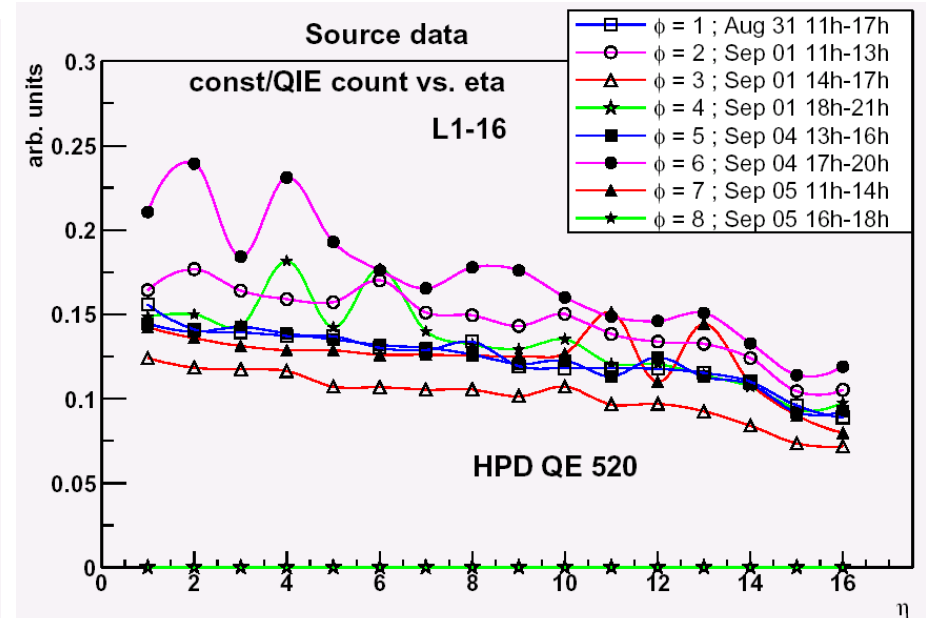

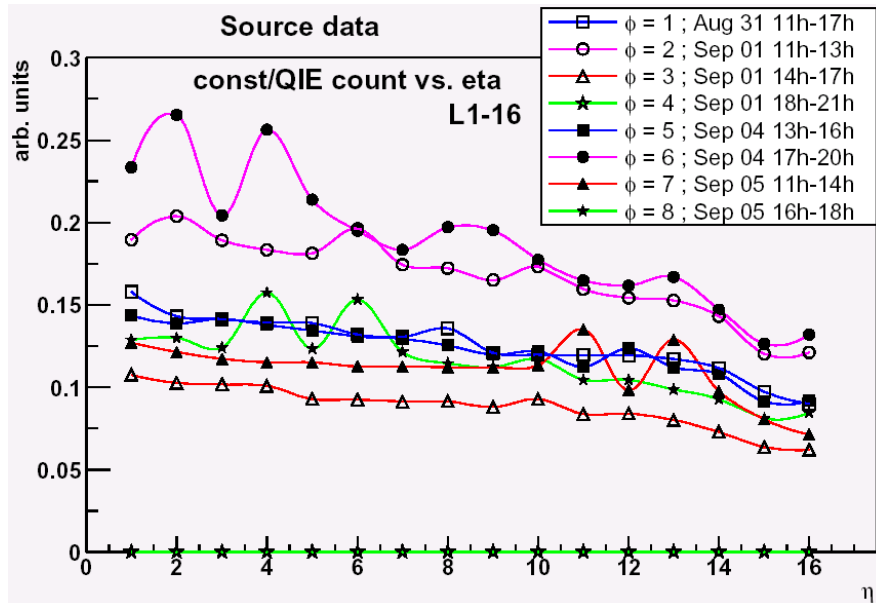

Source vs Beam Data

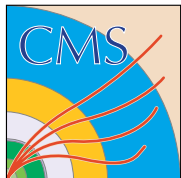

HPD QE Correction

HPD QE does not explain variation in phi fully.

ADC \rightarrow GeV

7 bits ADC

Inverting Input Scale (HPD Inputs)

Normal Mode			
Range (Exponent)	Input Charge	FADC Codes	Gain (q/Lsb)
0	-1 fC --- 14 fC	0---14	1 fC/bin
0	14 fC --- 28 fC	15---21	2 fC/bin
0	28 fC --- 40 fC	22---25	3 fC/bin
0	40 fC --- 52 fC	26---28	4 fC/bin
0	52 fC --- 67 fC	29---31	5 fC/bin

ADC Codes

00 - 31 (0 - 20GeV)

32 - 63 (17 - 119GeV)

64 - 95 (104 - 614GeV)

96 - 127 (539- 3089GeV)

Dynamic Range

Original Requirement:

Jets: 15-20GeV for top reconstruction/rejection
>3TeV for compositness & QCD

Readout: Et Threshold 500MeV
Max. E = 3TeV
Noise < 200MeV/time slice (<0.66 LSB)

QIE(ADC): 7 bits (128 integer codes in non-linear scale)
1-10000 counts equivalent in linear scale.

300MeV LSB

3TeV at the max scale

Resolution
Energy offset
Occupancy

0.9 LSB (TB2002)

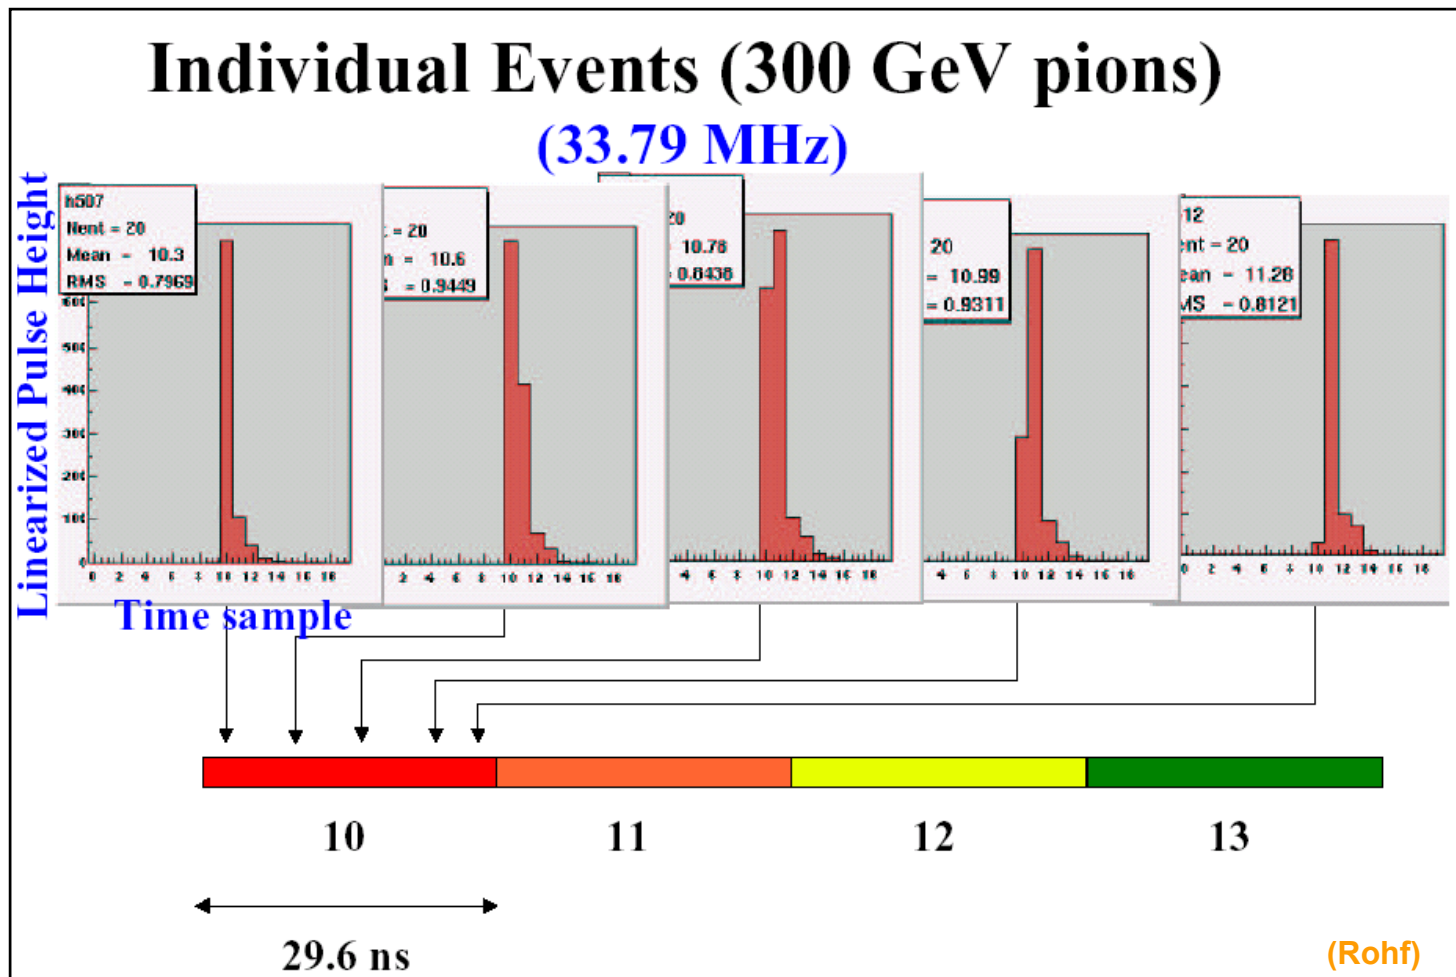

Pedestal: Higher statistics for better mean value
→ before/after physics runs.
→ during abort gaps.

Energy extraction:
→ Optical sum of layer 0 signal with others.
→ 1 or 2 time slices for signal extraction.

Signal in Time Slices

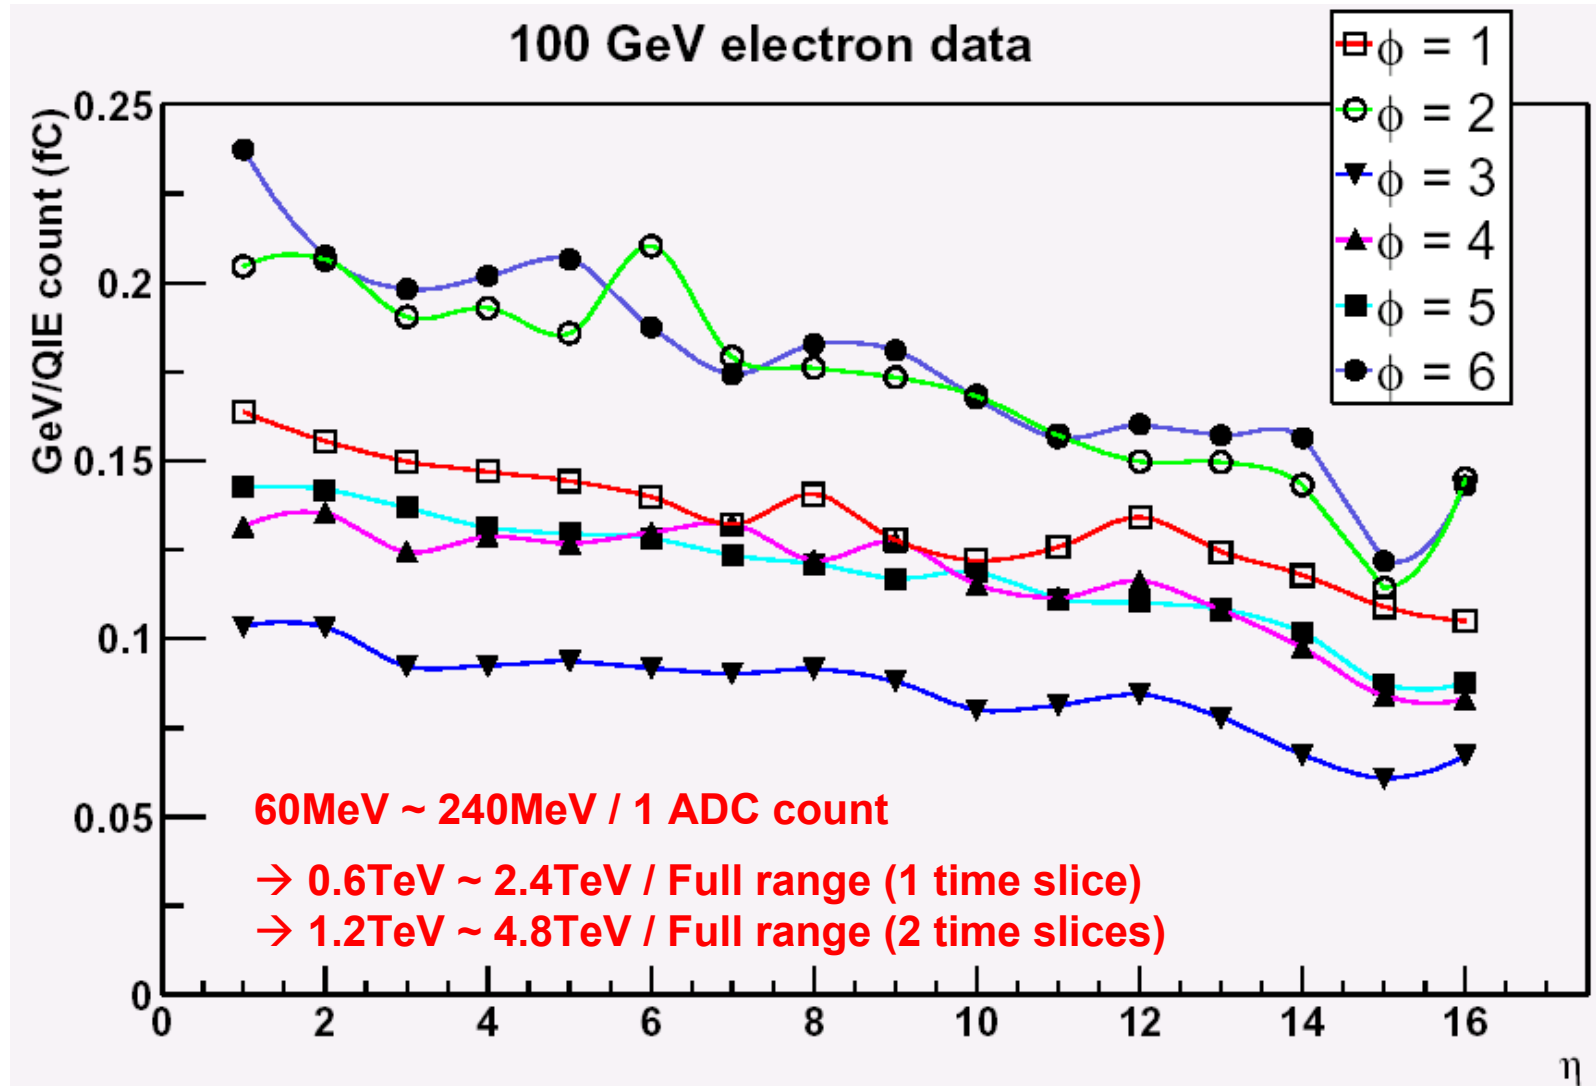

No synchronization between beam arrival time and QIE clock at TB.

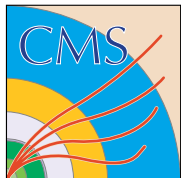

20 time slices at TB. (5~10 at CMS)

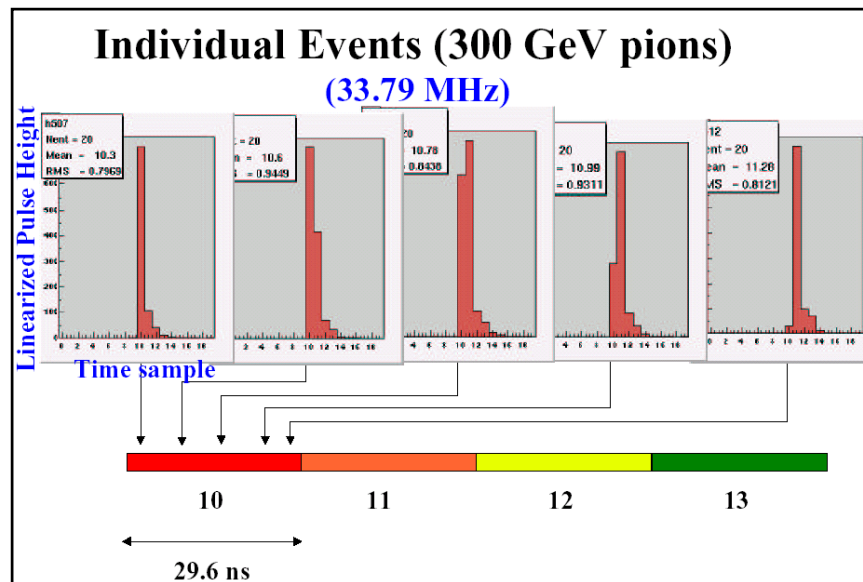

GeV/ADC

Adjust HPD Gain

1. Change HV to adjust gain.
2. Put lower gain HPDs in HE

For 3TeV

1 time slice : 300MeV/ADC, noise=270MeV

2 time slices: 150MeV/ADC, noise=212MeV

200

280

250

Pulse Shape

Pulse Shape Simulation

(S.Abdullin)

Scintillator + wave-length shifter

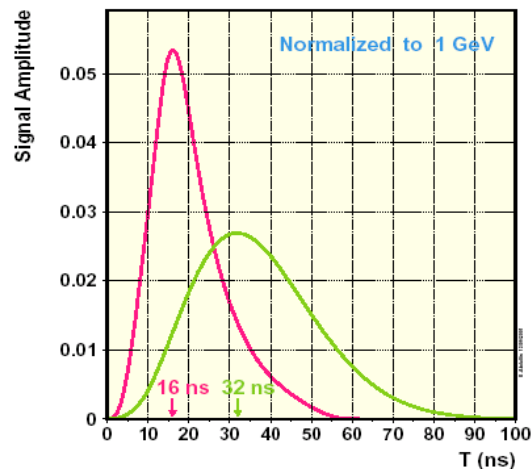

$$f_d(t) = \exp(-t/\tau_s), \quad \tau_s = 10 \text{ ns}$$

HPD

$$f_{HPD}(t) = 1.0 + (t/\tau_{HPD}), \quad \tau_{HPD} = 12 \text{ ns}$$

Preamplifier

$$f_p(t) = t * \exp(-t/\tau_p), \quad \tau_p = 5 \text{ ns}$$

Scintillator + wave-length shifter

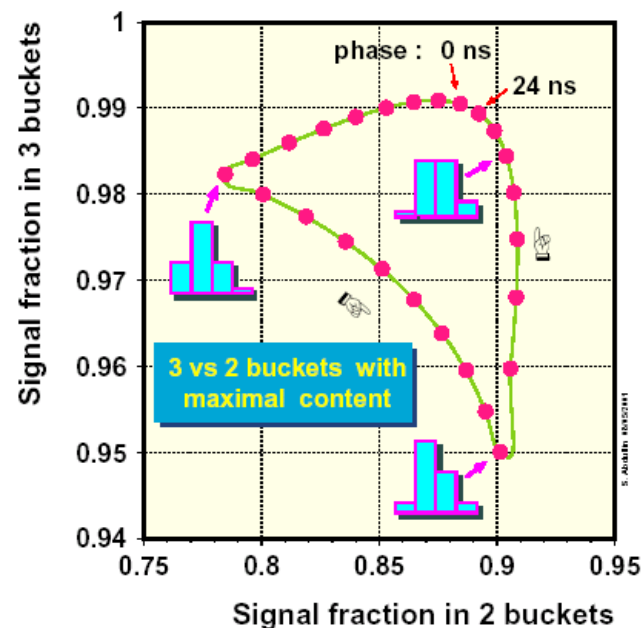

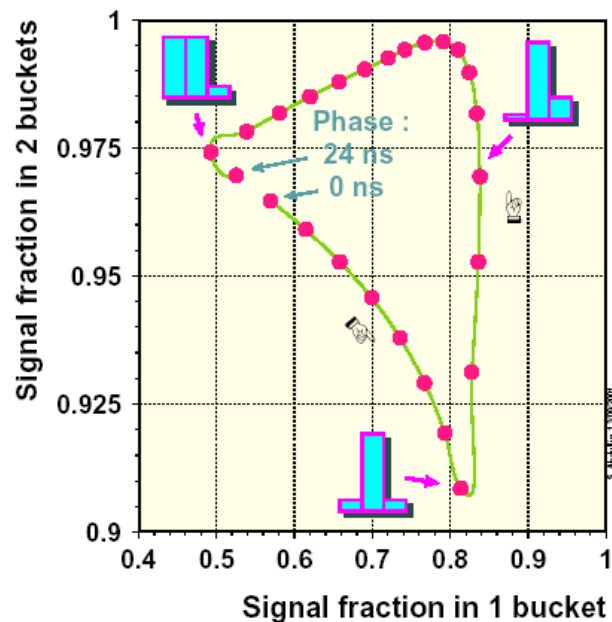

$$f_d(t) = \exp(-t/\tau_s), \quad \tau_s = 11 \text{ ns}$$

HPD

$$f_{HPD}(t) = 1.0 + (t/\tau_{HPD}), \quad \tau_{HPD} = 10 \text{ ns}$$

Preamplifier

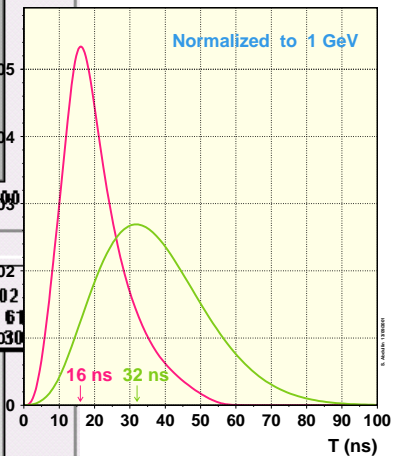

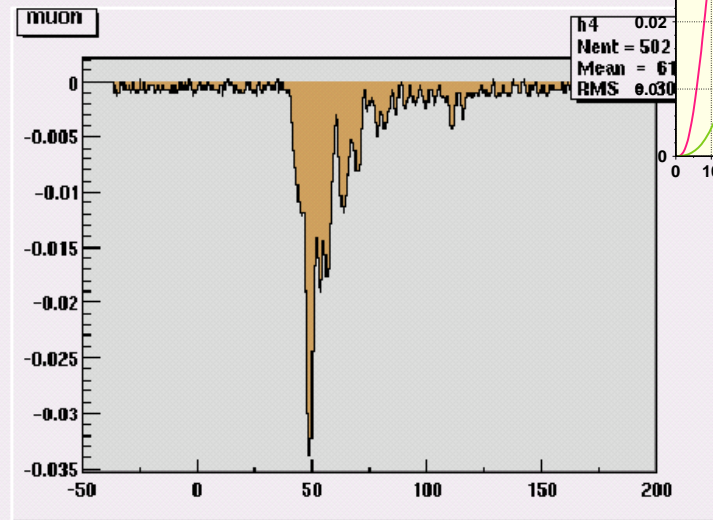

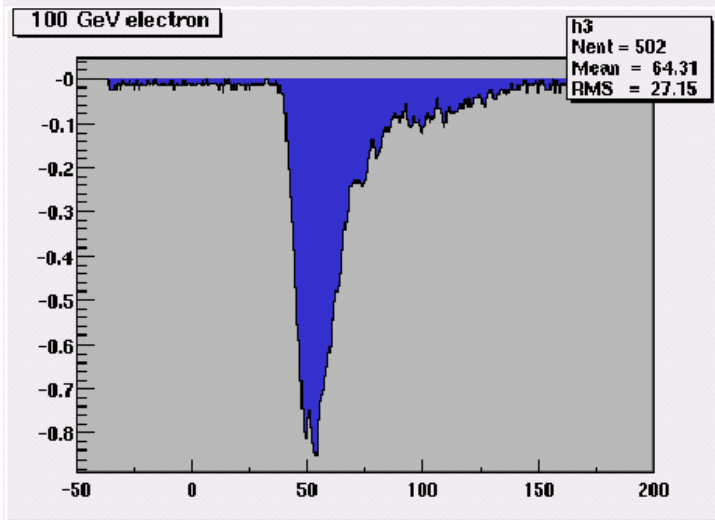

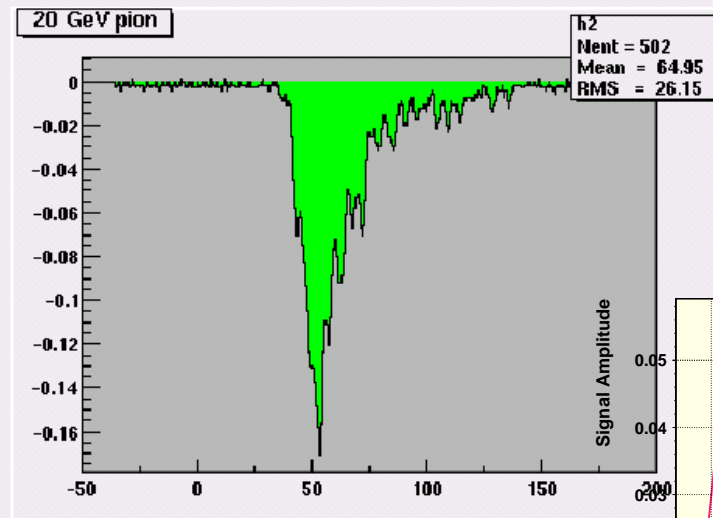

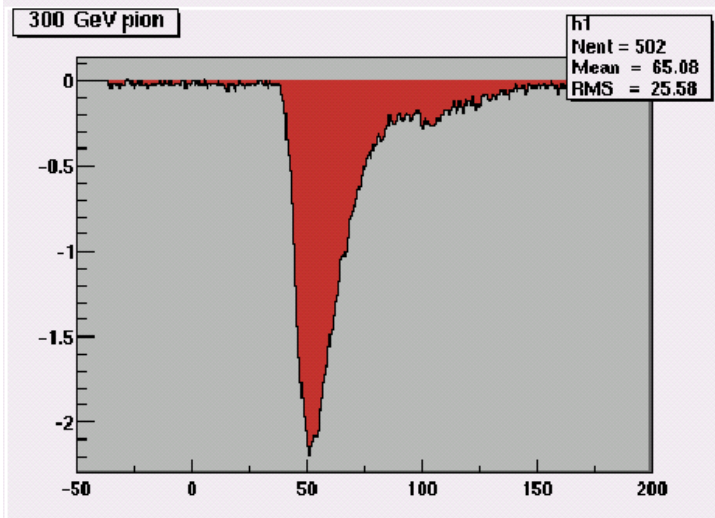

$$f_p(t) = t * \exp(-t/\tau_p), \quad \tau_p = 25 \text{ ns}$$

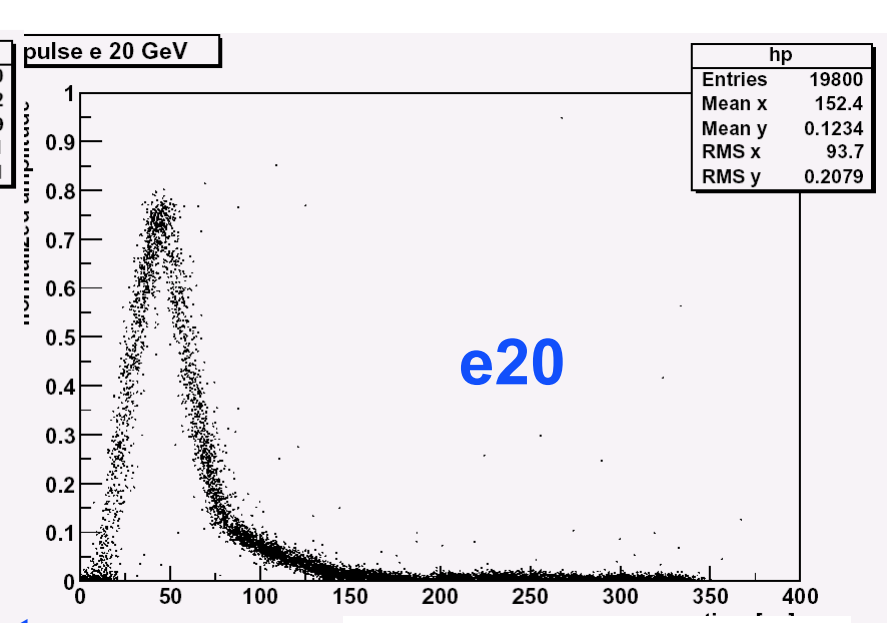

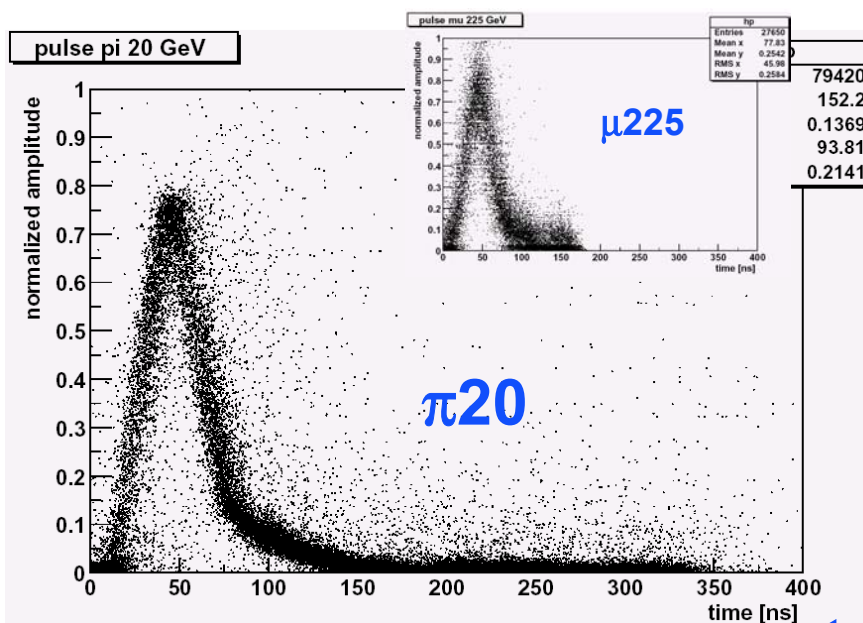

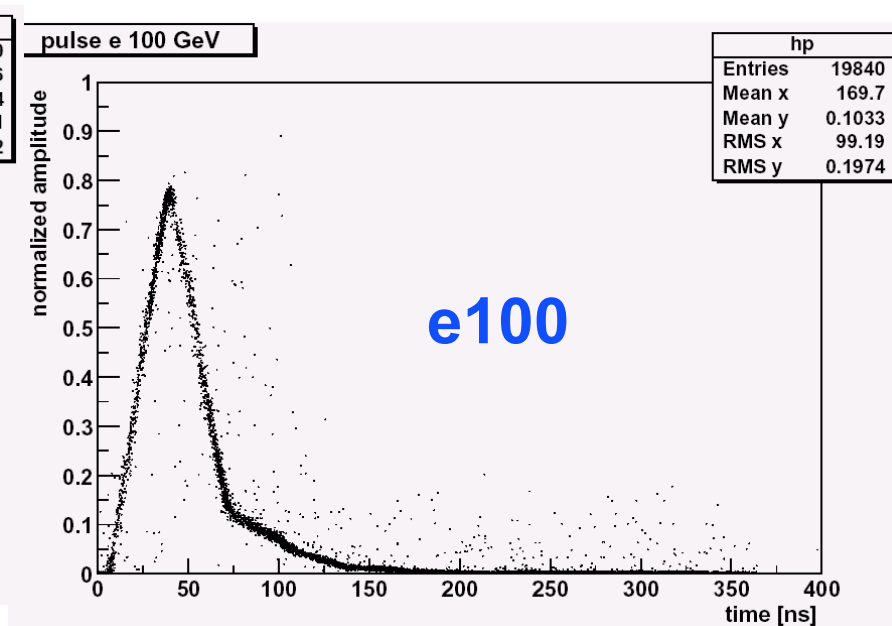

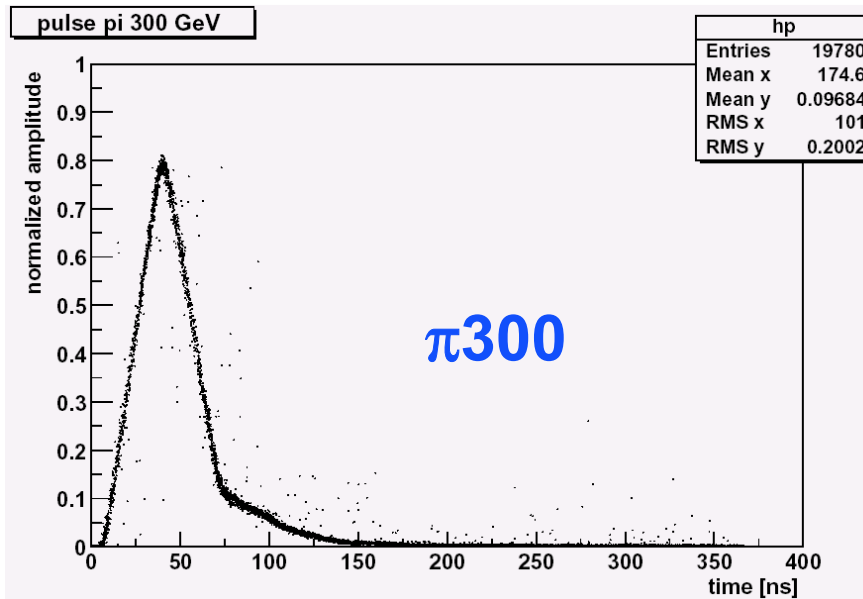

Scope Measurement with PM

(Elias/Rohf)

E_i/E_{all}

(Damgov)

$t_i - t_{s,mean}$

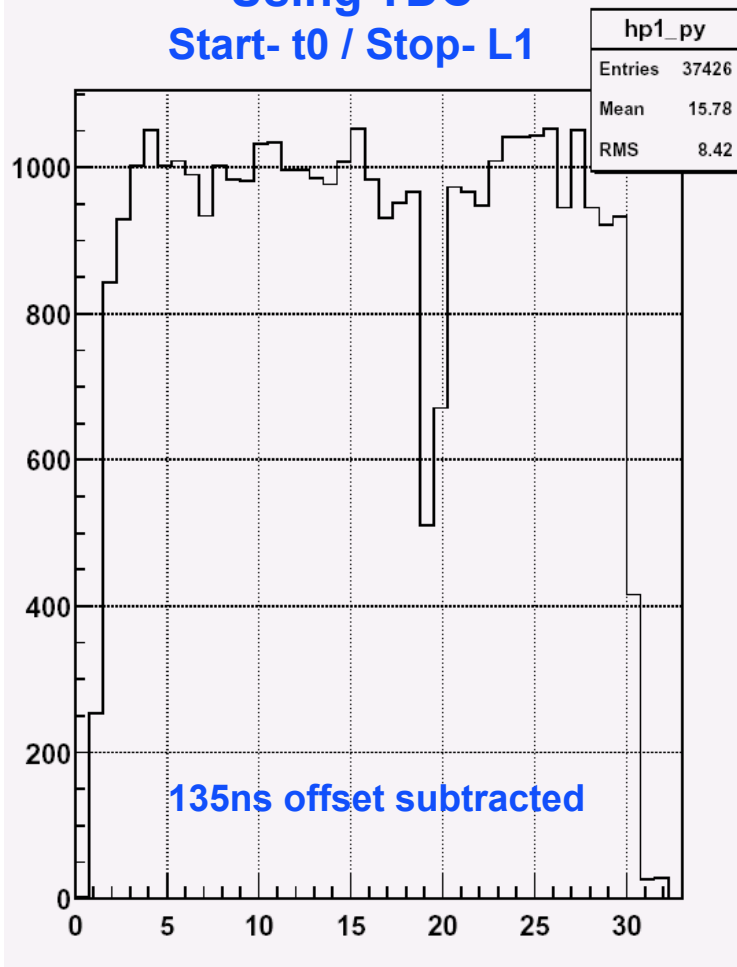

Need correction for 25ns/30ns!

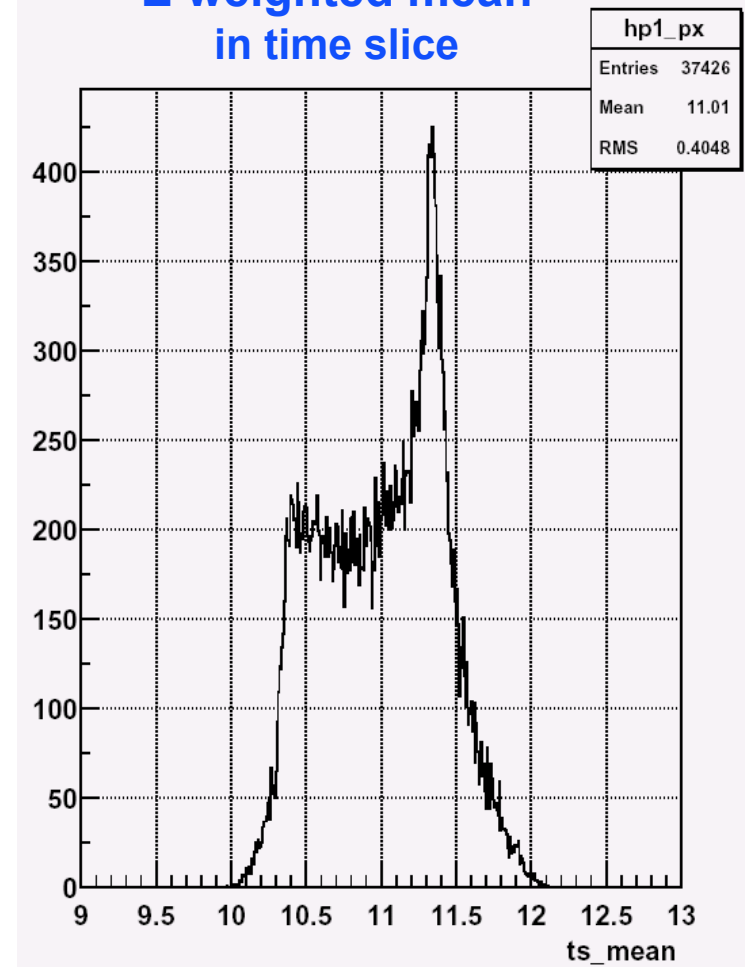

Two Phase Measurements

Run 3236, 300GeV pion, $E(\text{HC}) > 100\text{GeV}$

Using TDC
Start- t_0 / Stop- L1

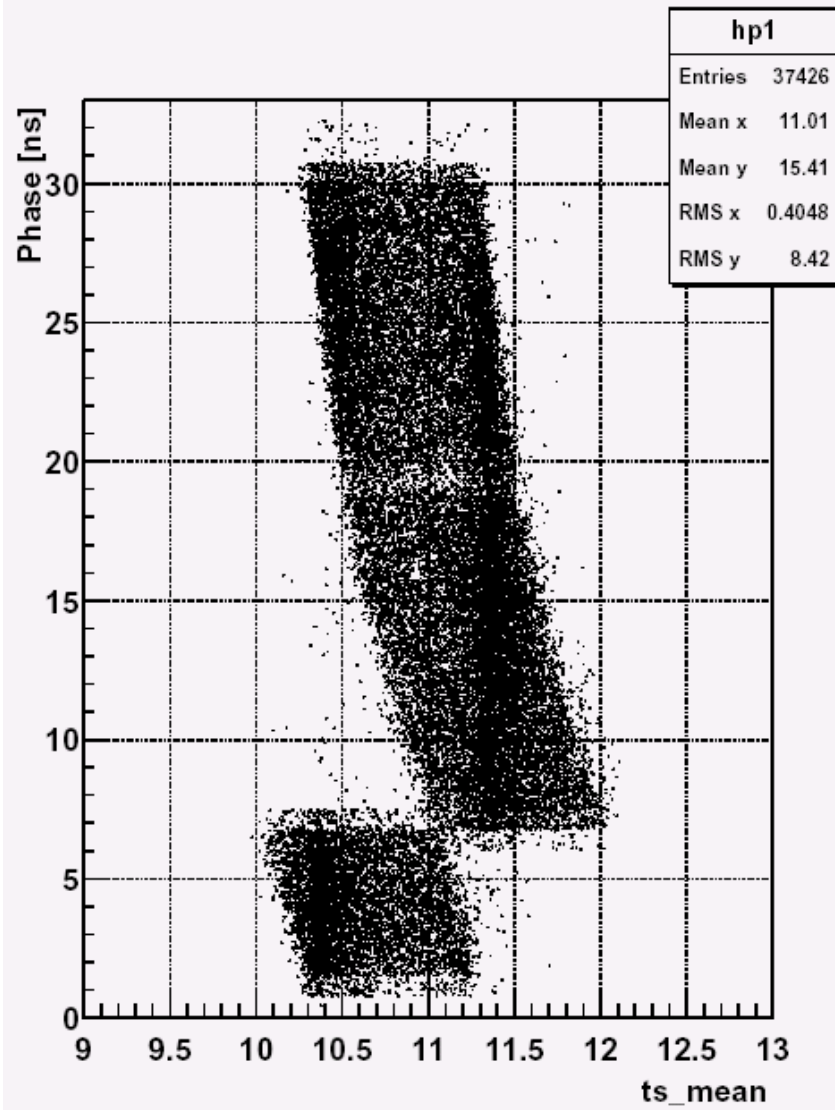

E weighted mean
in time slice

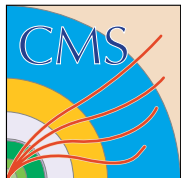

Phase (TDC) vs TS-mean

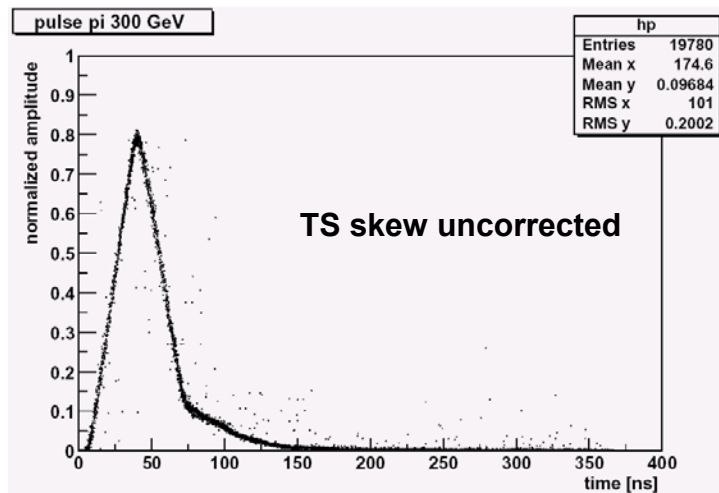

1 time slice wide
at a given phase.
... ???

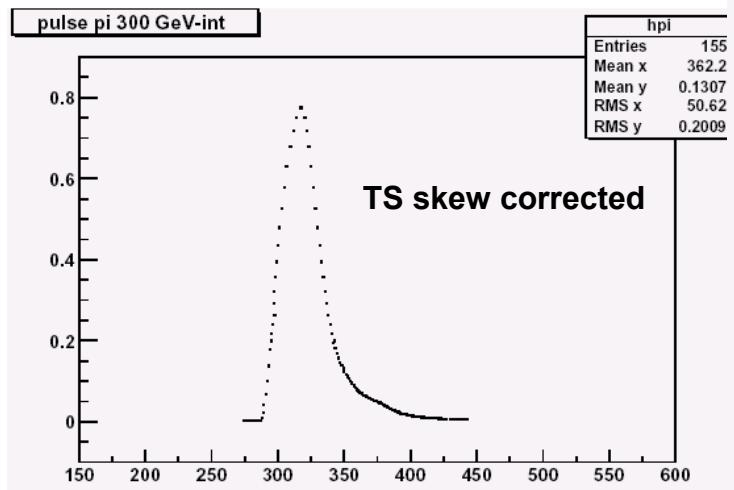

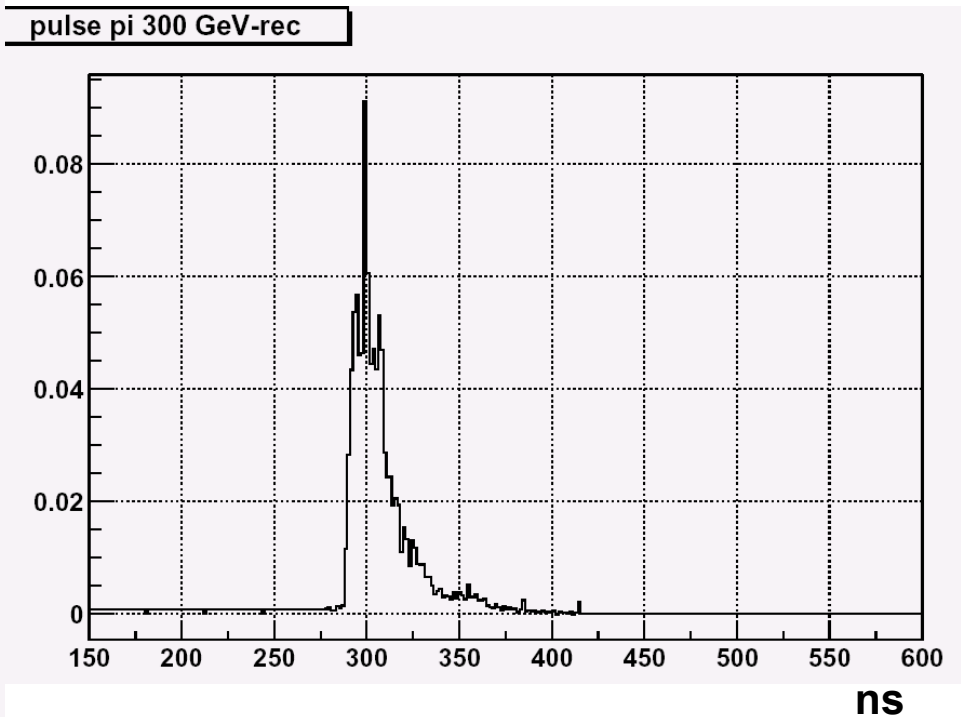

Pulse Shape

E in 30ns time slices

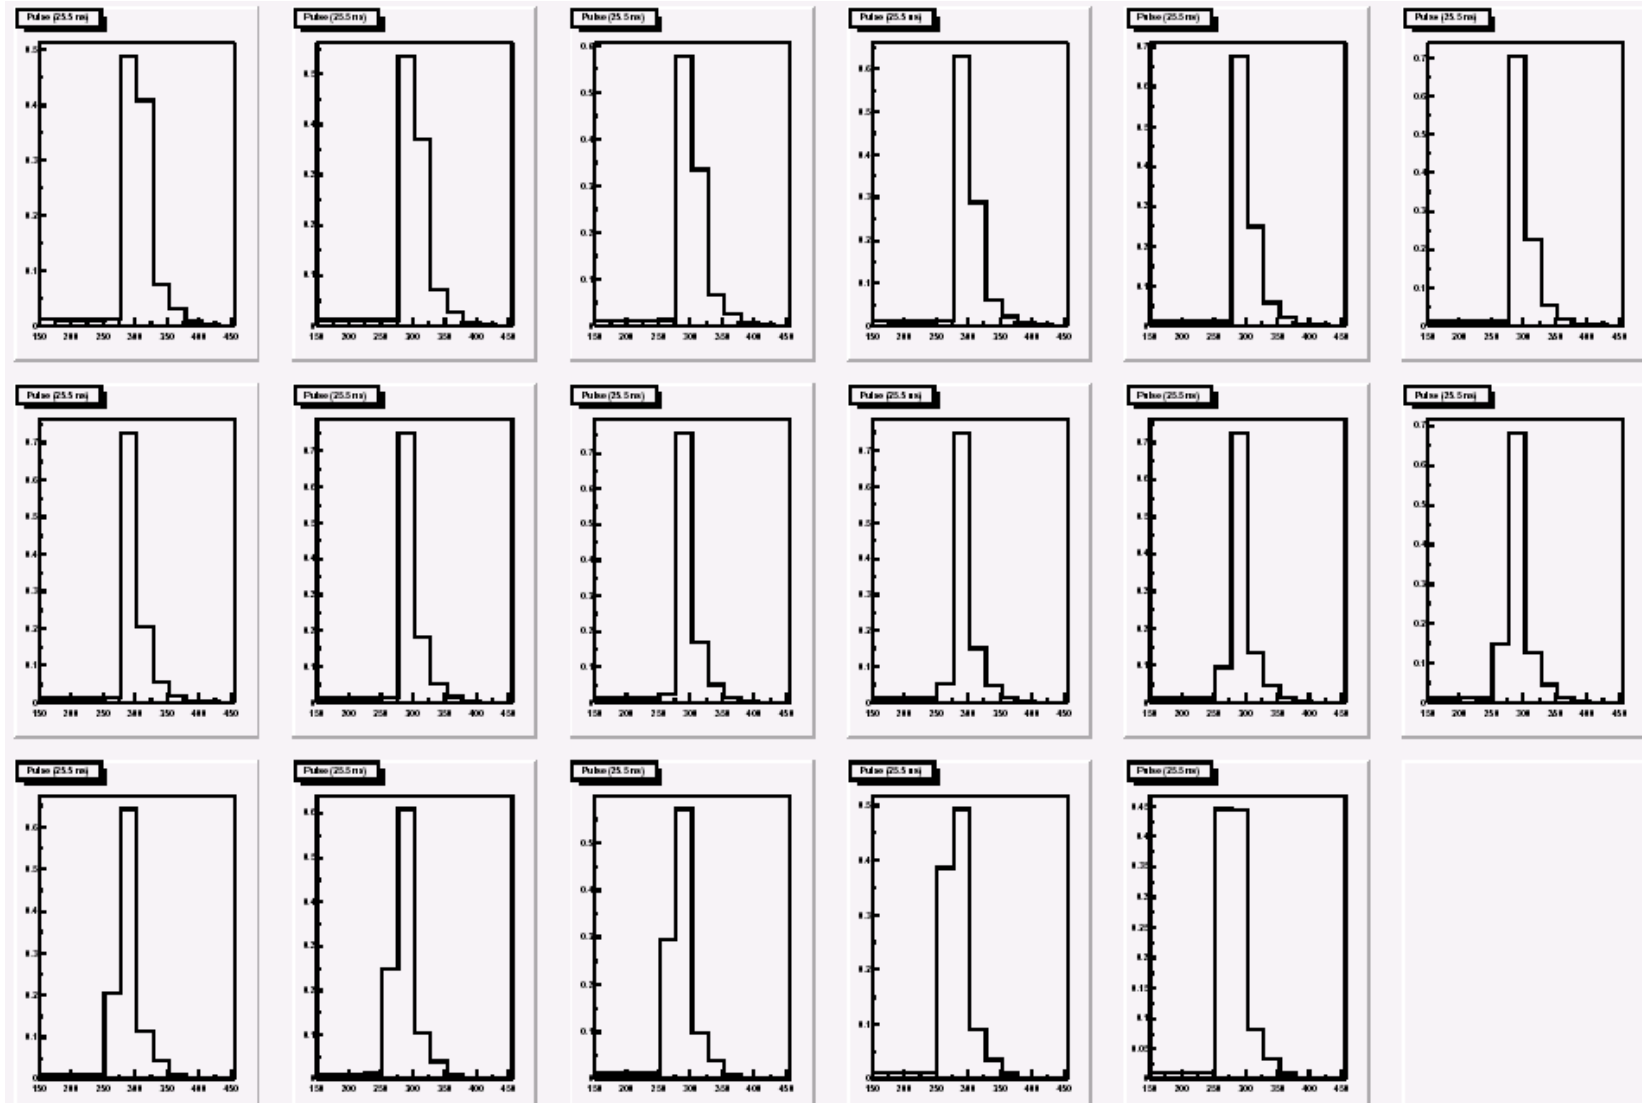

Reconstructed pulse shape

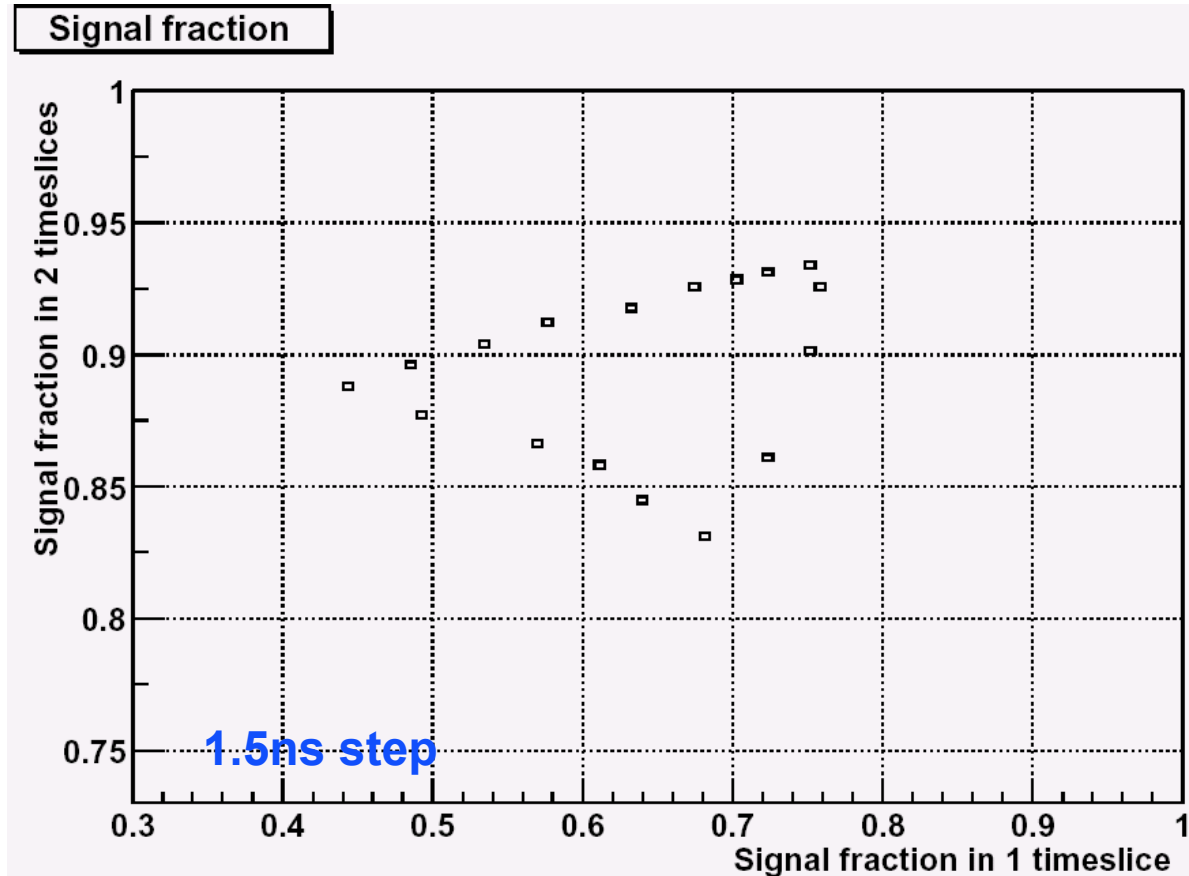

Signal in 25ns Time Slices

Energy Collection

Variation 2% (5%)
1 TS- 3ns (6ns)
2 TS- 6ns (12ns)

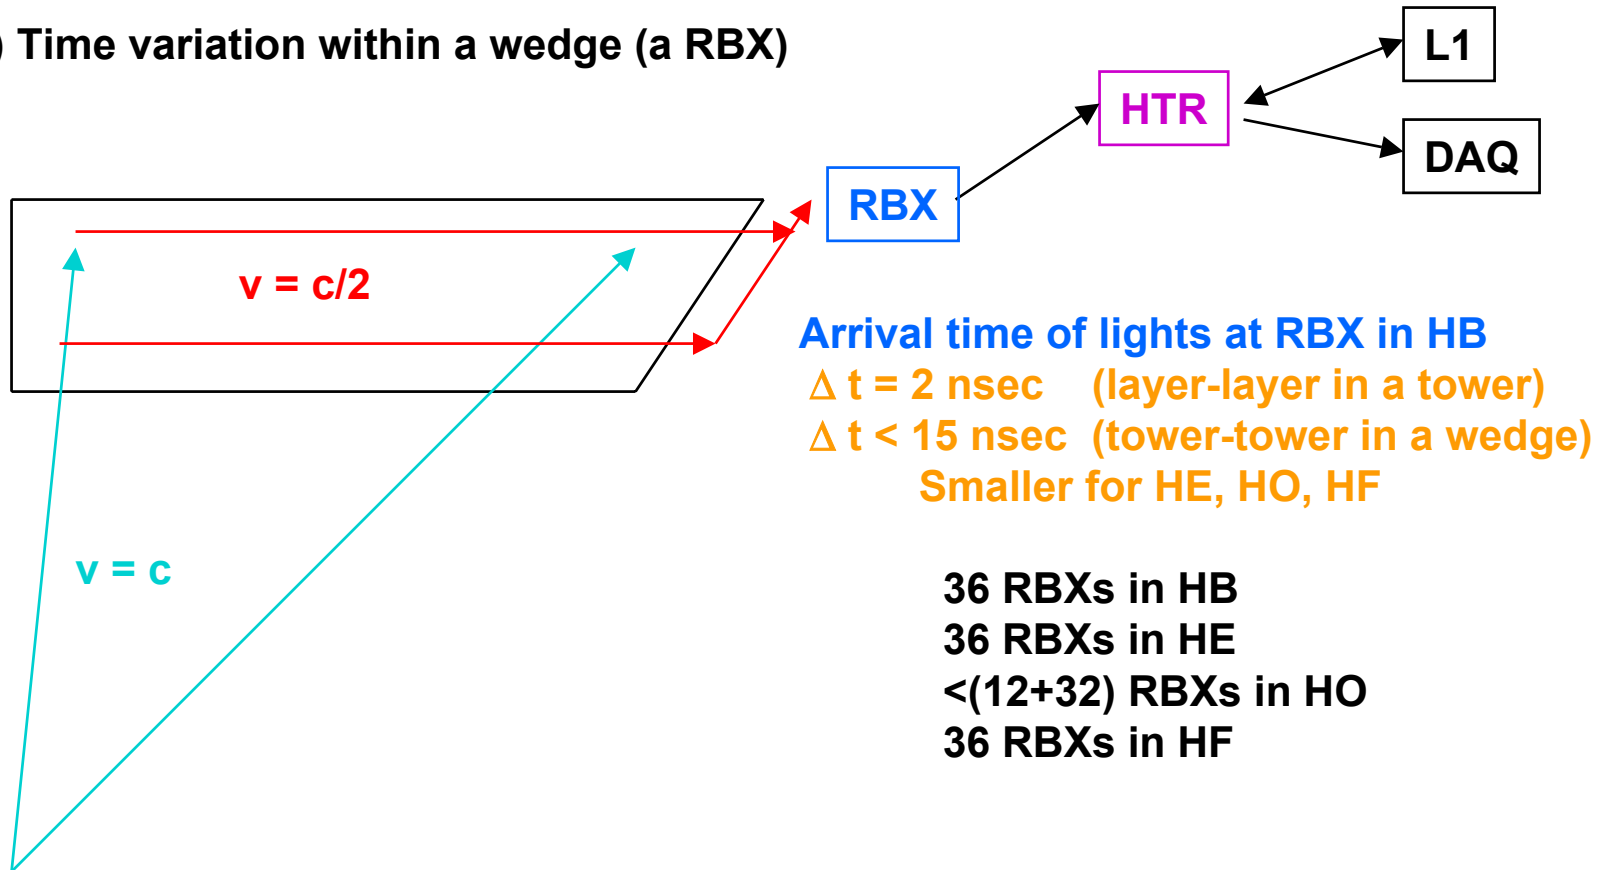

Eta dependence timing

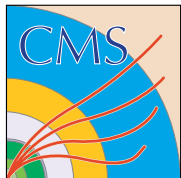

HCAL Timing Calibration

1) Time variation within a wedge (a RBX)

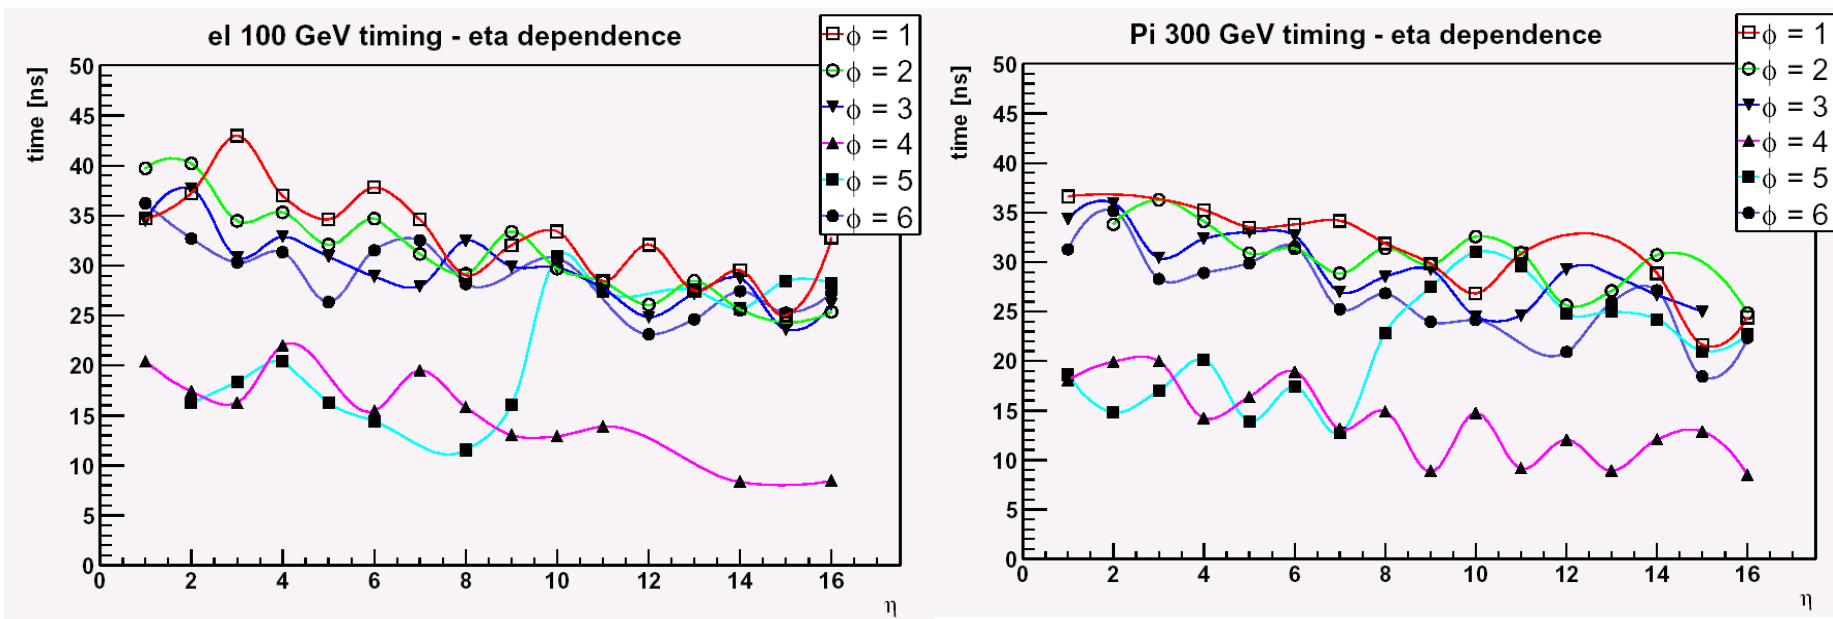

2) Synchronization (global)

L1 data, L1 accept (pointer to pipeline), 40MHz clock

eta dependence timing

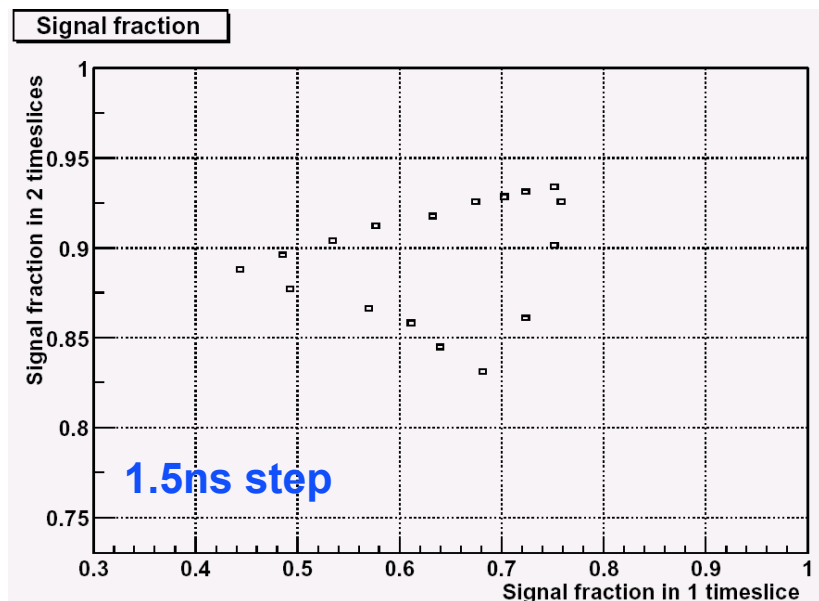

Calculated using corrected TS mean.

~10ns spread in eta 0 – 16

Time Correction in and among RBX

Variation 2% (5%)
1 TS- 3ns (6ns)
2 TS- 6ns (12ns)

QIE clock control ASIC

clock skewing by 1ns
over 25ns

Method

initial variation ~10ns
in hardware construction.

- Laser pulse to all tiles (20Hz).
- Monitor by reading out 5 time slices and histogramming the sharing fractions.

Adjust individual
timing to accuracy = 2~4 nsec.

HO for Muon Trigger

See Banerjee/Rohf's talk

Layer 0

Layer 0

Goal:

1. Overweight 1.5 or 3.0?
2. Demonstrate how to implement.

TB 1996 and MC indicated ~1.5!

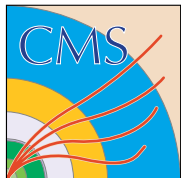

**Wt ~ 1.0
Implemented!**

(de Barbaro)

**Need real ECAL super module
to determine final weight.**

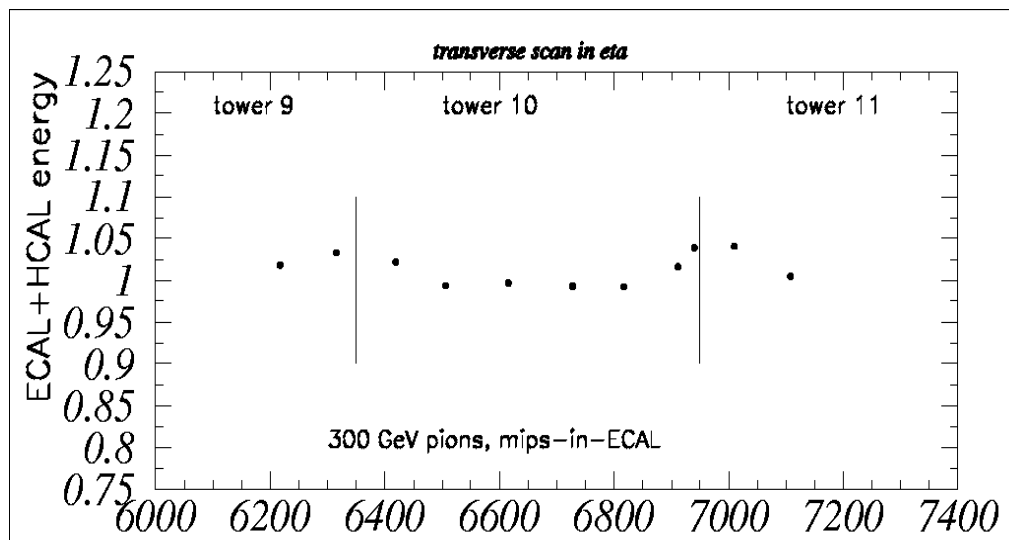

Crack Scan

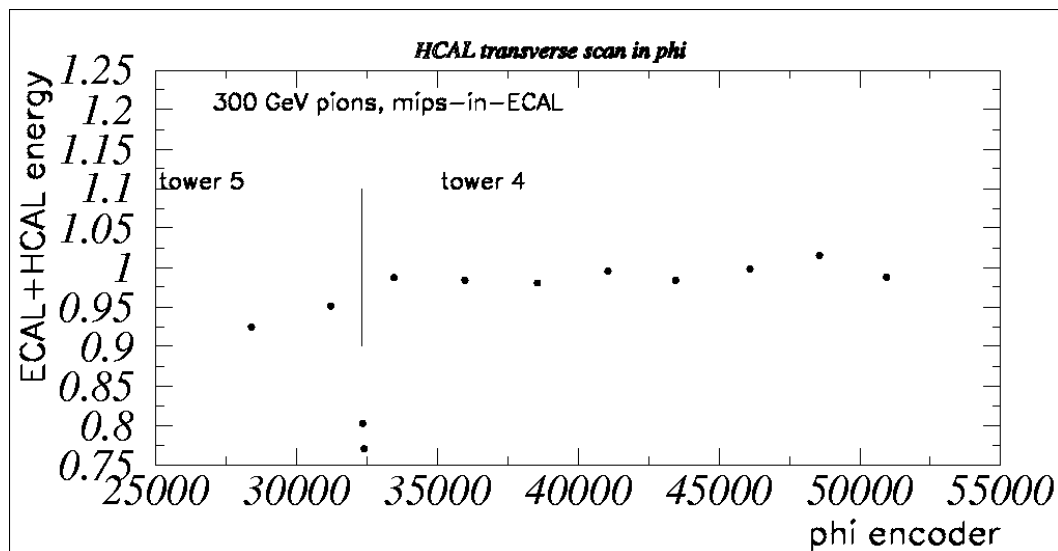

Crack/Tower Scans for HCAL

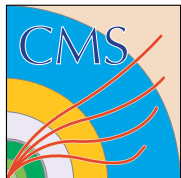

Eta scan

Phi scan

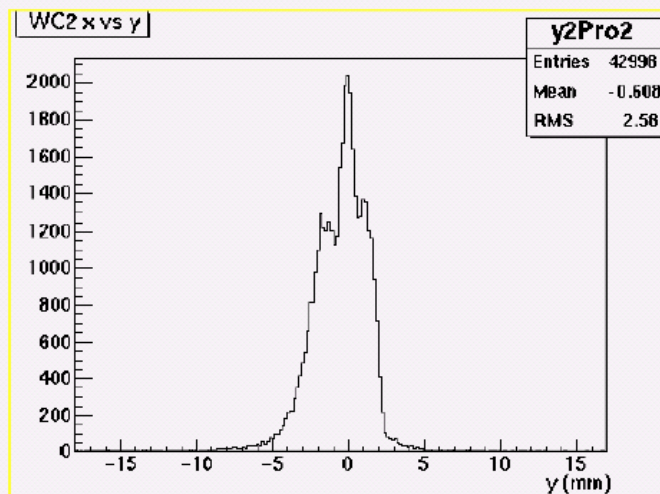

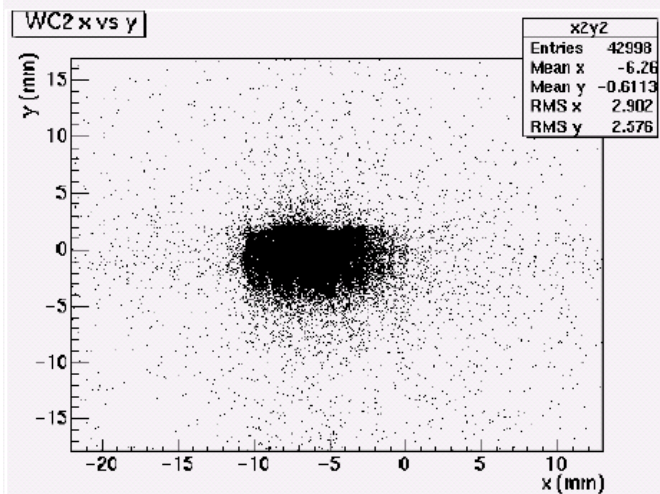

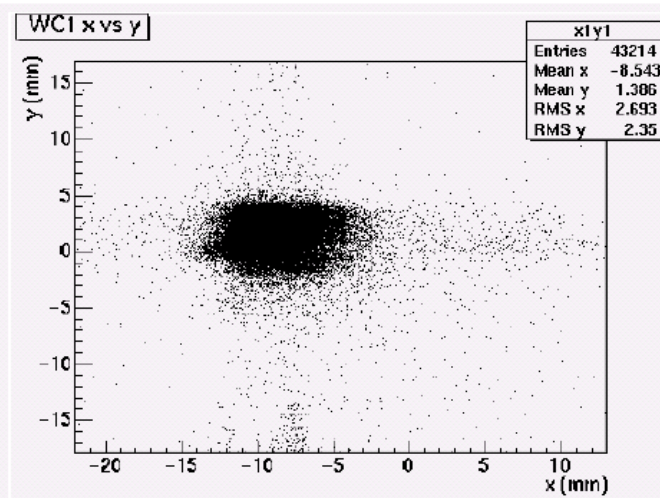

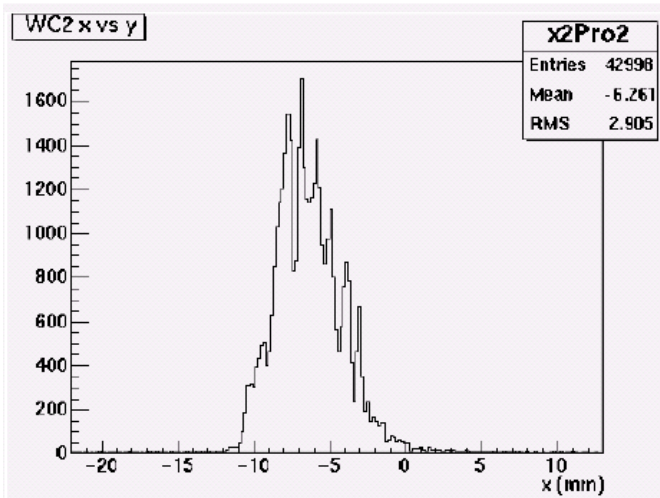

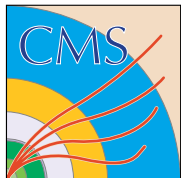

(P. de Barbaro)

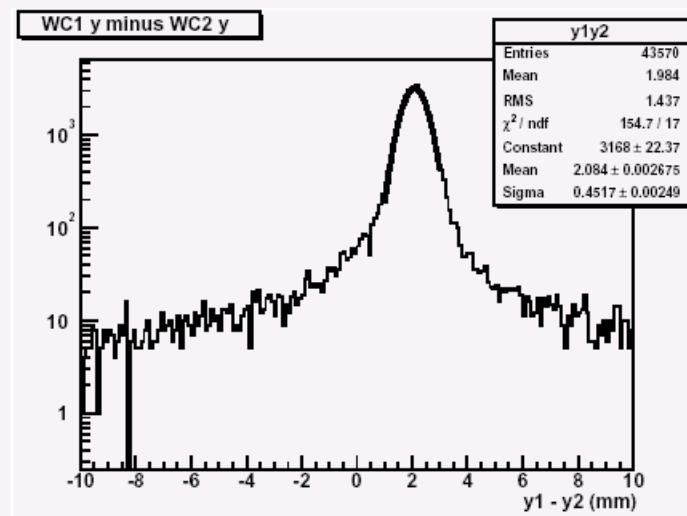

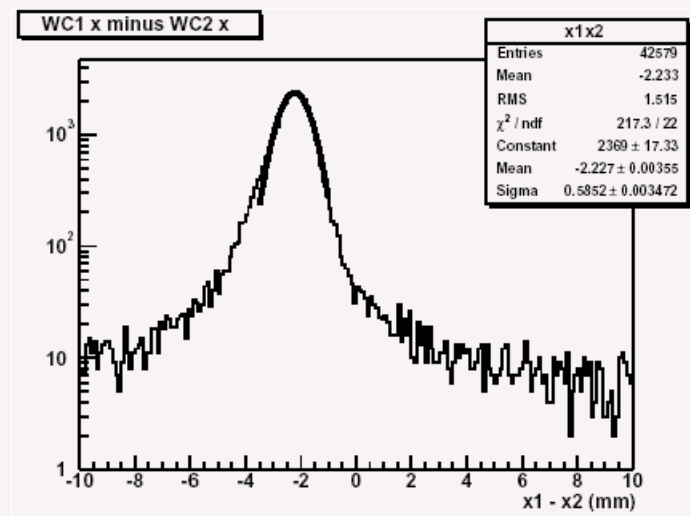

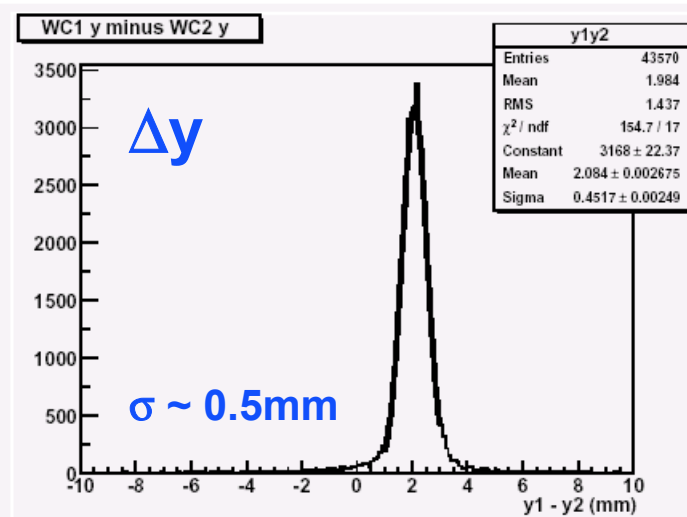

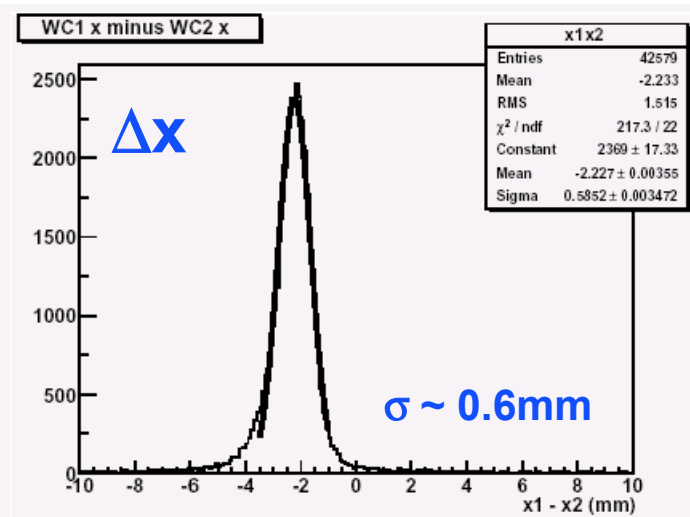

Wire Chamber

Wire chamber data useful after Run 2698. (R.Vidal)

W1-W2

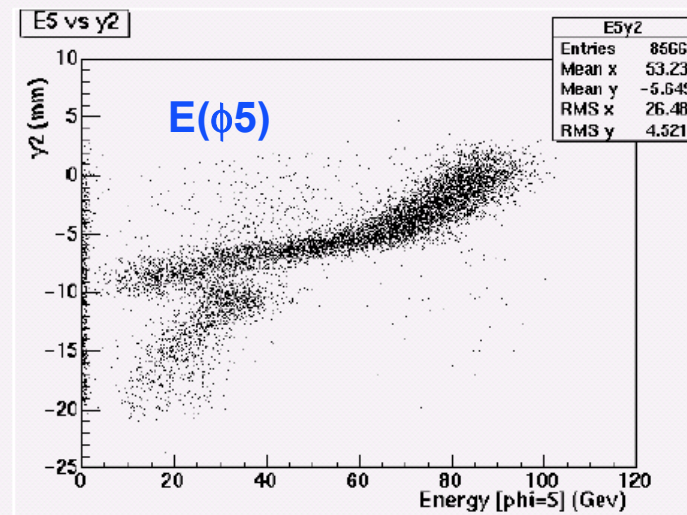

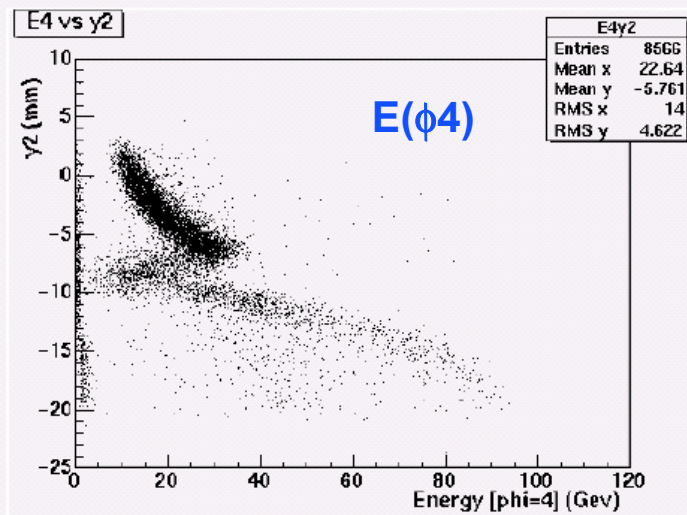

Ready for gap study!

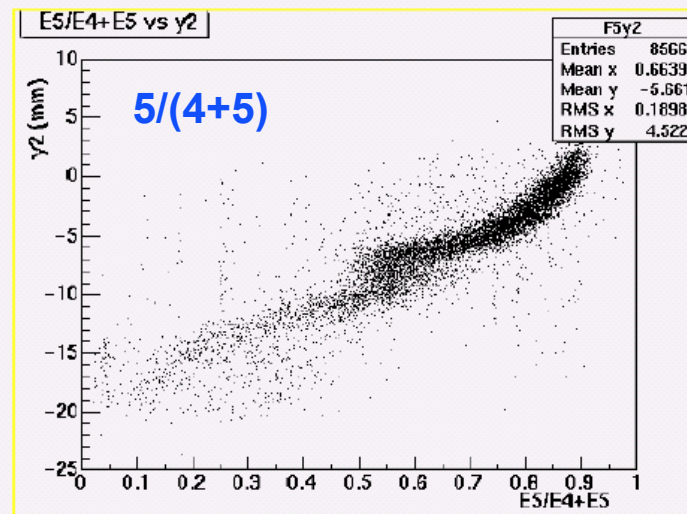

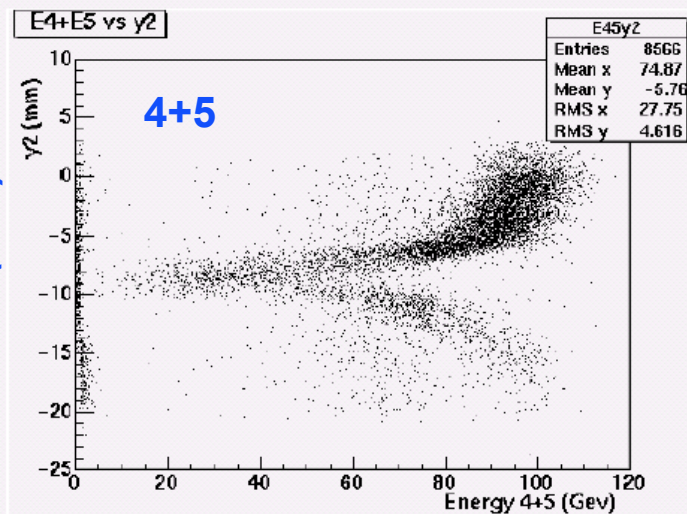

Crack between Wedges 100GeV electron

Y2 (mm)

Y2(mm)

air gap:
a few mm

put in MC

(Rick Vidal)

HB TB 2003 (my suggestion)

Goal:

- Repeat TB2002 goal
- Local synchronization. (time in all channels.)
- Operation of full calibration system, including laser.
- Generation of L1 primitive
 - Pedestal subtraction / gain correction / E to Et conversion / BX id (?)
- Remote monitoring and analysis.

Preparation: (addition to tasks obvious to get the goal)

- Before the TB period
 - HPD calibration (all) – QE
 - QIE calibration (all) – gain in full range for each CapID
 - Source calibration
- E-log book.

HB Testbeam 2002

Goals (HB):

- Demonstrate 144ch working
- Demonstrate DCS going
- Source data vs GeV/ADC
- Muon signal in HO for muon trigger
- Eta dependence (attenuation)
- Eta dependence (timing)
- Pulse shape (needs TDC)
- Weight in Layer 0

(beam: $e / \mu / \pi$)

→ start construction of Calibration Database

Additional Goals (left over from 1999TB)

- Crack between wedges
- e/π (resolution and linearity) ←
- Cerenkov light in clear fibers ←

Conclusion

QIE dynamic range.

- Not much head room for different input (HPD) gain.
- Need to control input gain by changing HPD HV.

QIE calibration

- Need to calibrate pedestal and gain (full range) for each CapID.

Source calibration

- Need to calculate constants for each CapID (and then average over 4 CapID)
- May require higher statistics (because of 4 caps and noise).

TB data analysis.

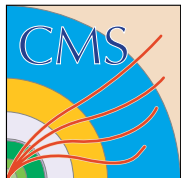

- Extract results for all defined goals.
- Finish by March 2003, and publish.

TB 2003

- New goals are suggested.

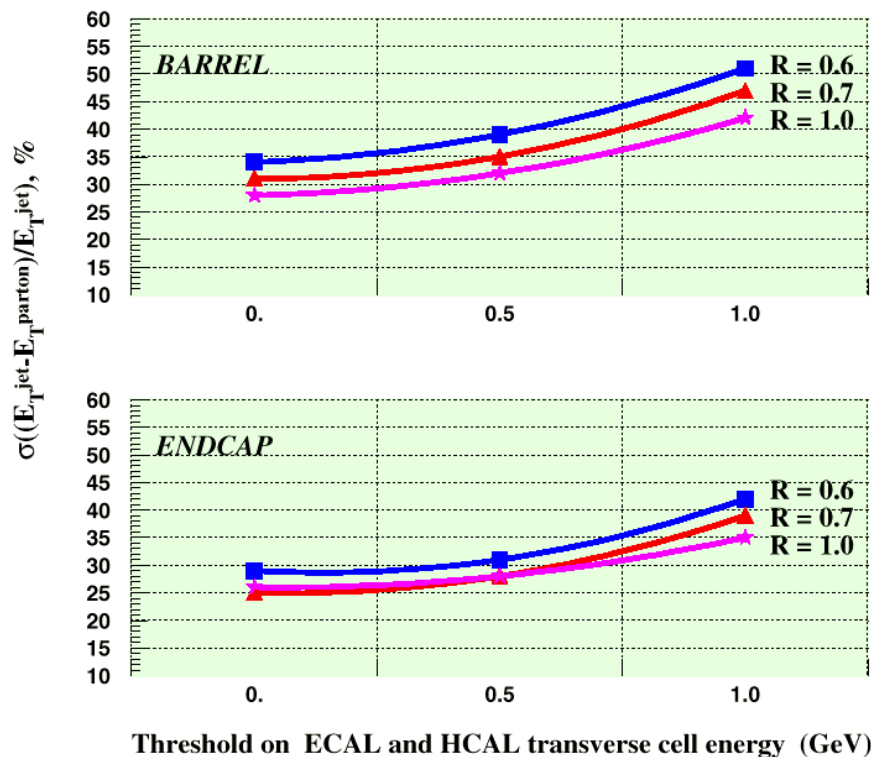

Additional

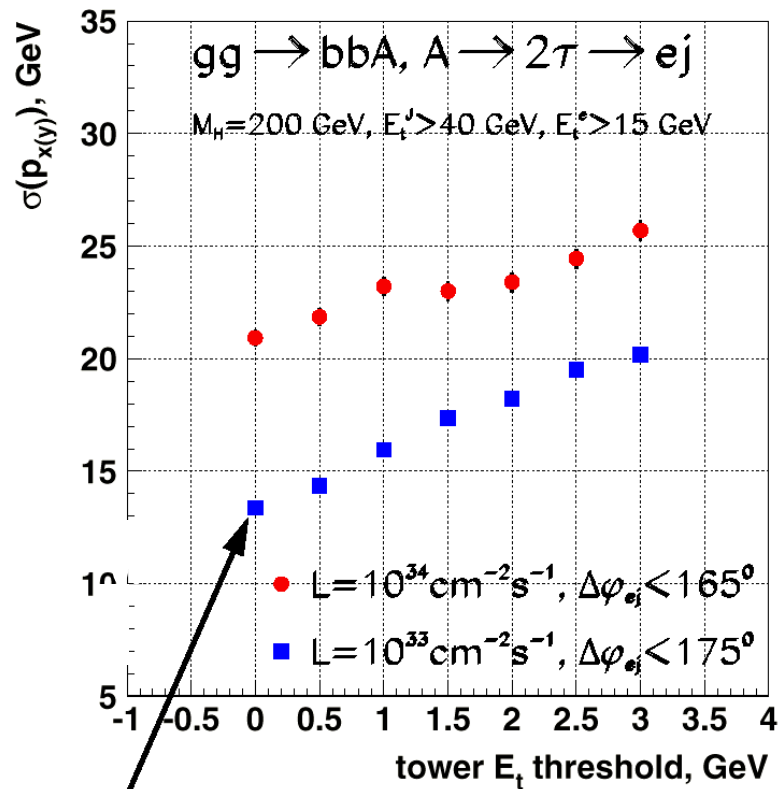

Effect of Threshold on low E_T jet and MET

(SK Dec 2001)

20GeV parton jet @ 10E34

MET

(I.Vardanian)

Lower threshold is better!

(S.Nikitenko)

Electronics noise and occupancy define the threshold.

>> aim at **0.5GeV/tower @ 10E34**

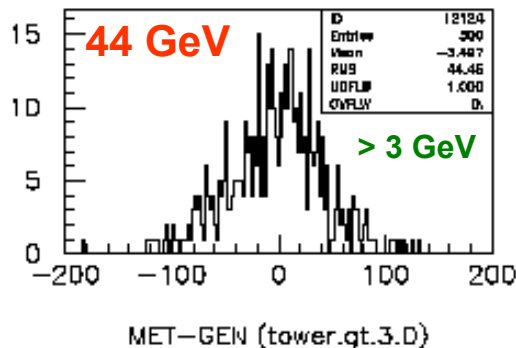

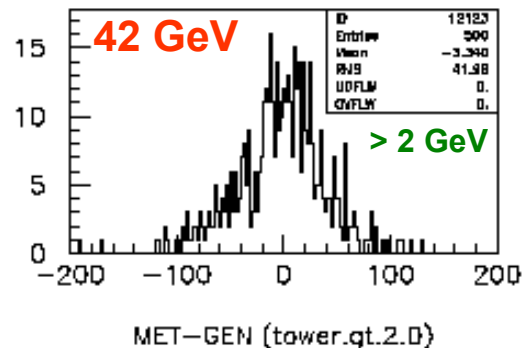

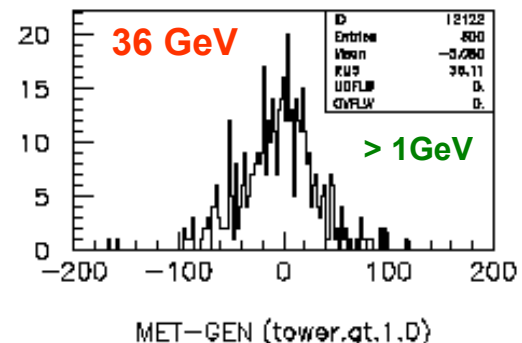

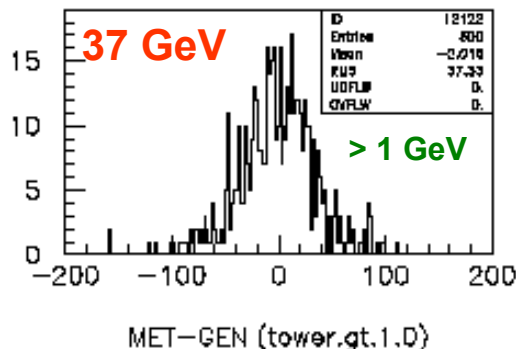

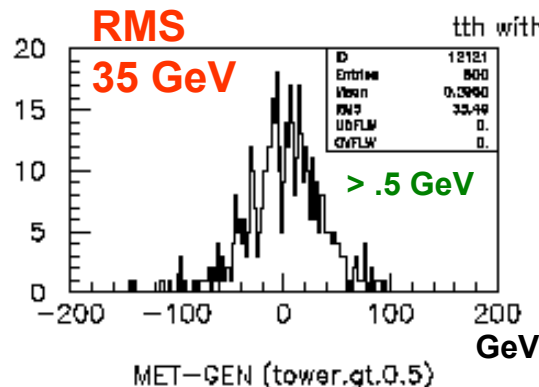

MET for Signal Events with Pile-up and Tower Threshold

(SK June 2000)

With 17.3 min-bias events

No min-bias

Tower = Ecal+Hcal

- >> Not much pile-up effect with this resolution!
- >> Resolution gets worse as threshold increase.

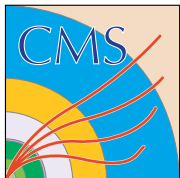

E in single HCAL readout

>3TeV jets 2.9fb \rightarrow 290 events/year at 10E34.

QCD bins	MC evts	Fraction of events above E threshold (%)					
		1.5TeV	2.0TeV	2.5TeV	3.0TeV	3.5TeV	4.0TeV
80-120	1000	1.40	0.60	0.30	0.00	0.00	0.00
2600-3000	2000	16.65	3.55	0.70	0.20	0.05	0.00
3000-3500	2000	28.85	7.40	1.75	0.30	0.10	0.05
3500-4000	2000	46.05	18.15	5.70	0.90	0.15	0.00
4500-5500	50	64.0	46.00	20.00	6.00	4.00	0.00

Need to cover up to 3TeV? YES.

(J.Damgov)

Source/LED-Laser/Beam
